! Present Volume

I have great pleasure in presenting the second volume of the General Report on the 1961 Population Census. It contains six chapters dealing with age, sex and marital status, education, language, religion, working population and non-working population. Volume I which has already been published has seven chapters dealing with the physical set-up of the Madras State with its historical background, growth and movement of population, urban and rural population and migration. It was my intention to include a chapter on the economic trends and projections for Madras State. But in view of the vast material collected, it has not been possible to include this chapter as part of the General Report. I hope to publish this as a separate volume in due course. In my preface to the first volume, I have indicated details relating to the programme of census operations and the various reports planned and published. I have also acknowledged the help received at all stages from the Registrar General, India and the Government of Madras.

In the preparation of this volume, I have been ably assisted by my Deputy Superintendent of Census Operations, Sri K. C. Narayana Kurup, Tabulation Officers, Sri M. K. Subramanian, Sri N. Rama Rao and Sri M. Panchapakesan and Smt. T. Saramma. My thanks are also due to the Alamu Printing Works who printed the report and Messrs. Klein & Peyerl who prepared the blocks of the charts and the Central Survey Office who printed the maps. With the publication of this report, I have a feeling of satisfaction that I have completed the programme which I undertook in connection with the 1961 Census.

Source: The aging of Populations and its economic and social implications. United Nations Department of Economic and Social Affairs, New York 1956 pp 8-9.

There are a number of countries with two-fifths or more of their population under 15 years of age, slightly above one-half in ages 15-64 and negligible proportions in 65 years and above. This type of age structure is characteristic of a population with high birth and death rates. At

the other extreme we have populations with about one-fifths of their totals in the young ages, 0-14, two-thirds or more in the age-group 15-64 and 7% or above in ages 65 and above. This type of population is found mainly in Europe, North America and Oceania and it is characterised by

low birth and death rates. There are other countries which can be regarded to be undergoing a transitional phase. In Japan and Yugoslavia, the decline in the death rate is well marked while the birth rates have only recently started falling. Such tendency will account for the large numbers under 15 years of age in several countries like Paraguay, Phillipines and the Dominican Republic. On the other hand, the age structure of Egypt has been more or less stable during the 40 years preceding the Census of 1947. The dynamics of the age structure has been the subject of some recent investigations notably by Lorimer and Lotka. The age structure is particularly important for the economy of countries like India which are passing through early stages of demographic transition. A high proportion of the population in the young ages imposes a heavy burden on the economically active population. There are over 90 persons under 15 and over 65 years of age for every 100 persons in the working ages 15-64 in Mexico, Costa Rica and Phillipines; in Sweden, Switzerland and United Kingdom there are fewer than 50 dependants per 100 persons in the working ages. In Madras State and India there are approximately 70 and 79 dependants respectively to every 100 persons in the working age-group.

### Age in the Censuses

2. In the present Census, age was ascertained as on last birth day before 1st March 1961, i.e. the number of completed years. This was the practice followed in all Censuses except in 1931 when the nearest age was ascertained, i.e. age on the next birth day. This change in the procedure came in for adverse criticism by Mr. Yeatts, the then Superintendent of Census Operations, Madras as a change of no significance because to an average citizen, the running age is not different from the completed years of age.

The Census has always recognized the difficulty involved in eliciting correct age. As such, the memory of the persons enumerated was stimulated by referring to historical incidents or religious events which have happened in the State, district or taluk. Actually, a list of outstanding occurrences was prepared, arranged chronologically and supplied to the enumerators. The intention was that the persons will be able to correlate childhood

to any event in the list which will help them in fixing their age approximately. This itself presupposes that age recording can only be approximate. This is the case with the illiterate section of the population. Normally, the reaction to any question is that their age ranges from 10 to 50. Then further questions will have to be put to illustrate in which range they will fall. In the this Census, we have come across where the wife's age is 25 while her is 17. A good deal of effort is needed the ages of mother, father and the ~~is~~ <sup>husband</sup> but again they are only approximations. It is no exaggeration to say that the age of many persons as recorded in their school or service book is quite different from their actual age. These variations in the official age and actual age will also be reflected in the age returns on which Census data are based. The only consolation we can draw from our statistics is that age will at least approximately fall in groups of 0-4 and 5-9 so that a composite picture of the age returns can be obtained.

The nature and definition of age data relating to the five Censuses during 1921-61 are summarised briefly in Table VIII-2.

In the 1941 Census, due to World War II, the material collected was not tabulated for age except for a few areas. Even for these areas, the usual age tabulation for the complete count was made for a few units only and for others, the age tabulation was carried out on a sample basis. After 1948, the position was re-examined and age tables by single years of age based on a 2% sample known as the Y sample were prepared and published for all Part A States. In 1951, the age tables for 1941 Census for the erstwhile Madras State were published and the figures in these tables were estimated from the information provided by the Y sample. In 1951, a further step was taken by instituting a systematic sampling scheme for single year age tabulations on a countrywide scale. For the first time, the 1951 Census furnished population by single years of age for every district on the basis of 10% sample. Further, an attempt was made to prepare age tables after adjusting for inaccuracies in the age data and the single year age tables were published for States and India as a whole. While misstatement of age has been accounted for, no

TABLE VIII — 2  
Age data in Madras Censuses, 1921—61

Census year	Question No.	Nature of definition	Table where available	Remarks
				5
1921		Completed years		The table is divided into two parts. Part I begins with a provincial summary wherein Statistics of every religion returned are given. Part II deals with the towns treated as "Cities", the city of Madras being excluded since its figures are included in Part I. In the Provincial summary details are given for each age upto 5 years of age, thereafter ages are grouped by quinquennial period upto 70 and the remainder shown as 70 and over. In Part I (Districts and States) and in Part II (Cities) age periods are given in less detail than in the provincial summary. No single year age data are available.
1931		Age nearest birthday	Table VII Part II Imperial Tables	do
1941		Completed years	Census of India Paper No. 8, 1951 Age Table for Madras Y sample	Estimated from Y sample (2%). No single year age data are available.
1951		Completed years	C-V of Part II B and Census of India Paper No. 3, 1954	Single year age returns are available for districts based on 10% sample. Graduated age data for composite Madras State are available in the Census paper.
1961		Completed years	C-IV of Part II C	Single year age returns are available for the entire population.

allowance was made for omissions in enumeration. These tables related to the composite Madras State and had to be reconstructed for the present Madras State.

In the 1961 Census, the sampling scheme of 1951 Census was dropped and single year age tabulation was done for the entire population. Thus age data can be collected fairly extensively for the last 5 Censuses and the material is extensive

enough for a study of the peculiarities of the Madras age returns in the various age sectors and for drawing inferences about the plausible method of correcting them

#### The nature of the age return

3. Even in the case of statistically advanced countries, biases in the Census age returns are present. These are, however, of a moderate

degree and do not affect their usefulness so seriously as they do in the case of countries like India. They are usually due to following reasons: (i) ignorance of age (ii) deliberate mis-statement (iii) omission in enumeration (iv) failure to reckon precise age due to misunderstanding of the question and (v) the manner of obtaining information from the informant. In India due to large-scale illiteracy, people are ignorant of their own age. In view of general ignorance of age, the age return would still fall much below the level of accuracy of the age returns of advanced countries. While ascertaining the age, certain age digits come to have a heavy concentration whereas in the case of other digits, the number gets depleted. The graphs showing the individual population of persons, males and females, in Madras State may give an idea of the pattern of age bias. Digital preference really refers to deliberate preference for certain digits in returning age and avoiding others. There is also a tendency to mis-state age, e. g. women may understate their ages while young men may tend to overstate them or old persons may exaggerate their age. Some of the distributions may be caused by omissions in enumeration.

### Testing the age data

4. In the 1961 Census Paper No. 2 of 1963 (Age Tables) a detailed analysis of age data has been made State-wise. This report has dealt with the following aspects of age data.

1. The pattern of Indian age biases by State, sex and rural-urban differentials as shown by the various indices.
2. The method of graduation and smoothing.
3. Grouped age data and application of Quasi-Stable Population theory.

The said volume may be referred to with advantage for a technical treatment of the subject.

### Index of concentration and preference

As regards the well known Whipple's index of concentration and Myer's index of digital preference the report on "Age Tables" states:

"Whipple suggested an index of concentration, which is obtained by taking the percentage of persons counted at ages in multiple of 5 in the age range 23-62 to one-fifth of the total enumerated population in the range. If there is no

concentration, the index should be 100, but if everybody returned his age only in multiple of 5, the index would be 500. The observed index will thus lie between 100 to 500. The method assumes approximately uniform decrements with age in the true population within each five year age-group centering on an age ending in 0 or 5. Age range 23-62 is arbitrarily chosen, largely because heapings are prevalent in this period and because the assumption of uniform decrement is not very well borne out for higher ages. The range has been found quite suitable for practical purposes. Myer defined a more comprehensive index for reflecting preference or dislike for each of the ten unit digits 0 to 9. In view of the fact that in India return of age above 60 is very unreliable, we may limit its application to the range 20-59. A series of ten totals for successive values of unit digit  $q = 0, 1, 2, 3, \dots, 9$  of population counted at ages  $10p + q$  where  $p = 2, 3$  and  $4$  in the age range 20-49 is obtained. Another similar series of ten totals for  $p = 3, 4$  and  $5$  in the age range 30-59 is obtained. The two series are blended into one series by adding the first series weighted by  $u$  and the corresponding term of the second series weighted by  $v$  so that  $u + v = 10$ , where  $u$  successively takes the values  $1, 2, \dots, 10$  and  $v = 9, 8, 7, \dots, 1, 0$ . If ages are correctly reported, every term of the blended series will be about 10% of the total of the series. Deviations from 10 (ignoring sign) when added, give an overall measure of preference. Theoretically, Myer's index can vary from 0 to 180. It may be considered that the proportion of total population ( $P_x$ ) counted at ages  $x = 10p + q$  in a specified age range, 20-59, say, for successive values of  $q$  from 0 to 9,  $p$  varying from 2 to 5, will reflect the relative preference for each digit. This is not quite correct, since even in a life-table population, where there is no mis-statement of age, the number living at successive ages forms a decreasing series due to operation of mortality alone. As remarked by Myer, "Since beginning at a given digit overstates the preference for that digit, and progressively understates it (relatively) for subsequent ones, 'Complete Justice' to each digit may be achieved if start is made at each one in turn". Such a start is provided in Myer's method as explained below:

The first term of the blended series is  $P_{20} + 10(P_{30} + P_{40}) + 9P_{50}$ , the second is  ${}_2P_{21} + 10(P_{31} + P_{41}) + 9P_{51}$  and so on and the tenth, the last one is  $10P_{29} + 10(P_{39} + P_{49}) + 9P_{59}$ . The sum of these ten terms by rearrangement of the component single year populations equals the sum of populations in the age ranges 20-49, 21-50, ..... 29-58. In these sub-groups, each digit gets its turn as a starting point and thus 'Complete Justice' is accorded to each.

From practical considerations both the methods are good enough, but both have some theoretical shortcomings."

The indices of concentration and preference for Madras State are as follows:

1961				1951			
Index of Concentration		Index of Preference		Index of Concentration		Index of Preference	
Males	Females	Males	Females	Males	Females	Males	Females
279	308	70.5	81.3	251	270	59.5	66.

For 1961, the index of preference for Males (70.5) is nearly the same as that of all - India (70.7). As regards females, the Madras State's figure (81.3) is more than that of India as a whole (75.1). The index of concentration for males is 279 for Madras State whereas it is 282 for all-India. As regards index of concentration for females the figure for Madras State (308) is higher than that of all - India (294). It is significant to note that whereas for the whole country, the index of concentration for females is higher than that for males by about 12 points, the difference is as much as 29 points for Madras State. Obviously, the bias in the age return for females is considerably greater than that of males in Madras State.

Myer's index of digital preference for Madras State is given below.

	0	1	2	3	4	5	6	7	8
Males 1961	7.6	0.9	2.4	1.3	1.1	7.0	1.5	1.8	2.0
Males 1951	5.8	0.9	1.9	1.1	1.3	4.8	1.5	1.3	1.8
Females 1961	10.0	0.8	2.5	1.2	1.1	9.0	1.6	1.8	2.4
Females 1951	7.1	0.9	1.9	1.0	1.3	5.5	1.5	1.3	1.9

The Myer's index brings out the ratio of the blended population at the selected digit to that at age 9. If there were no preferences for any digit the ratio should have been nearly unity. The digit '9' is the least preferred. It is observed that in this State, digit one has an index even below unity, showing that 1 is more disliked than 9.

#### Age distribution and graduation

5. In view of the fact that the single year population given by the Census is marked by pronounced heapings at preferred ages, a set of graduated and smoothed single year age population is given in Part II, Section II of "1961 Census Age Tables" (Paper No. 2 of 1963) after graduation and smoothing of age data. It may be mentioned in this connection that the single year age returns do not have much meaning except in term of appropriate quinquennial group totals which themselves need graduation and smoothing since the age biases do not cancel out within the group. The smoothed age data, therefore, represent a reasonably correct distribution of population by single year of age. These data may be useful for various purposes in the field of education, health, labour etc and for studies of economic and social structure of the population.

The following table gives for the State the percentage distribution of population among the different age - groups (omitting the category "Age not Stated" which has got a negligible percentage of persons).

Age-group	Percentage
0 - 4	13.7
5 - 14	23.9
15 - 24	17.3
25 - 34	15.7
35 - 44	12.2
45 - 54	8.9
55 - 64	5.3
65 +	3.0

The percentage rises by a fairly high degree from the age-group 0-4 to the age-group 5-14

SINGLE YEAR AGE OF POPULATION OF MADRAS STATE, 1961.

SINGLE YEAR AGE OF MALE POPULATION, 1961.

and then gradually decreases in the higher age-groups. We may call the persons in the age-group 0-4 as infants and young children, those in the age-group 5 to 14 as boys and girls, those in 15 to 24 and 25 to 34 age-groups as young men and women, those in 35 to 44 and 45 to 54 as middle-aged men and women and those in 55 to 64 and 65 and higher age-groups as elderly persons. It is observed that young men and women form the maximum percentage in the State (33.0 per cent), followed by boys and girls (23.9 per cent), middle aged men and women (21.1 per cent) infants and young children (13.7 per cent) and elderly persons (8.3 per cent). In India as a whole also this pattern is maintained - 32.1 per cent young men and women, 26.0 per cent boys and girls, 19.0 per cent middle aged men and women, 15.1 per cent infants and young children and 7.8 per cent elderly persons.

The Swedish Statistician, Sundbarg has enunciated a rule of thumb measure of population growth. According to him, a normal population has about one-half of its total between the ages 15 and 50 and the proportion of those above that age to those below it indicates whether the population is increasing, stationary or decreasing. The youngest of the three population groups must be double the eldest if the population is to continue to grow; just short of that point, it may be stationary but if the elder continues to exceed the younger, the population would be regressive. We may take the age-group 15 to 44 as representing the middle age-group as far as Madras State is concerned so that the youngest and the eldest age-groups will be 0-14, and 45 and over. The percentage distribution among the three age-groups is as follows

Age-groups	Percentage
0 - 14	37.6
15 - 44	45.2
45 +	17.2

The population of Madras State belongs to the progressive kind.

We may now discuss the age structure of the population under the following five broad categories: 1) infants and young children, 2) boys and girls, 3) young men and women, 4) middle aged men and women, 5) elderly persons.

### Infants and young children

The table below gives the percentage distribution of infants and young children in the general population of the State and in each of the districts

	1961	1951
State	13.7	12.1
Madras	13.2	9.2
Chingleput	14.1	11.9
North Arcot	14.7	12.7
South Arcot	14.3	12.8
Salem	14.1	12.1
Coimbatore	12.7	11.9
Nilgiri	15.2	12.9
Madurai	13.9	12.5
Tiruchirapalli	13.0	11.9
Thanjavur	13.2	11.4
Ramanathapuram	13.9	12.5
Tirunelveli	13.0	12.1
Kanyakumari	14.1	15.2

It will be seen that there has been a definite increase in the proportion of infants and children in the State as well as all the districts except Kanyakumari. The general increase is mainly due to the declining trend in infantile mortality and increasing facilities with regard to medical facilities.

### Boys and girls

The table below compares the proportion of boys and girls in the population in the age-group 5-14 with the 1951 figures.

	1961	1951
State	23.9	24.1
Madras	23.0	22.2
Chingleput	23.4	23.8
North Arcot	24.4	25.0
South Arcot	23.3	23.2
Salem	25.0	25.6
Coimbatore	24.1	24.8
Nilgiri	26.1	22.0
Madurai	24.0	25.0
Tiruchirapalli	22.7	23.4
Thanjavur	23.4	22.9
Ramanathapuram	23.6	23.6
Tirunelveli	24.1	23.7
Kanyakumari	27.1	25.1

In the State as a whole, there is only slight decline, viz. 0.2 per cent in respect of the proportion of boys and girls. Notwithstanding the general decline in the birth rate since 1931-41 decade, the proportion of boys and girls had remained almost stationary in the State as a whole during the decade 1951-61. It is observed that the variation in the proportion of boys and girls has been less than one point in the following districts: Madras, Chingleput, North Arcot, South Arcot, Salem, Coimbatore, Tiruchirapalli, Thanjavur and Tirunelveli. There was no variation at all in the case of Ramanathapuram district. Nilgiri district had registered a definite increase from 22.0 per cent to 26.1 per cent. In Kanyakumari district, the proportion has increased by two points from 25.1 to 27.1. In Madurai district the proportion has declined by unity from 25.0 to 24.0.

#### Young men and women

The proportion of young men and women in the age-groups 15-24 and 25-34 in the State and districts is as follows:

	1961	1951
<b>State</b>	33.0	33.6
Madras	37.6	38.9
Chingleput	33.1	33.7
North Arcot	31.6	33.3
South Arcot	32.2	33.3
Salem	32.5	32.9
Coimbatore	33.7	33.6
Nilgiri	34.8	32.3
Madurai	33.6	33.2
Tiruchirapalli	33.4	33.7
Thanjavur	32.8	34.4
Ramanathapuram	32.7	32.5
Tirunelveli	32.0	32.8
Kanyakumari	31.3	33.6

Except for a very small increase in Coimbatore, Madurai and Ramanathapuram districts and an increase of 2.5 points in Nilgiri district, there is a general decline in the proportion of population belonging to this category. Noting a similar

decline, the 1951 Census report for Madras State states: ".....there is a decrease in the proportion of the population in this age-group due to the increase in the proportion in the higher age-groups. As longevity increases, the proportions in the higher age-groups increase and there is a decrease in the age-group 15-34. The largest proportion of the population is in this group (33.5 per cent). The proportions in the lower age groups are smaller so also the proportions in the higher age-groups." Even now the largest proportion of the population (33.0 per cent) may be categorised as young men and women.

#### Middle aged persons

The table below gives the proportion of middle aged persons, i.e. persons in the age-group 35-54 for 1961 and 1951.

	1961	1951
<b>State</b>	21.1	21.7
Madras	20.0	21.3
Chingleput	21.0	22.0
North Arcot	20.5	20.6
South Arcot	21.7	22.5
Salem	19.9	21.0
Coimbatore	20.8	20.9
Nilgiri	19.0	25.0
Madurai	21.2	22.0
Tiruchirapalli	22.3	22.3
Thanjavur	22.1	23.0
Ramanathapuram	21.5	22.2
Tirunelveli	21.4	21.9
Kanyakumari	19.1	18.5

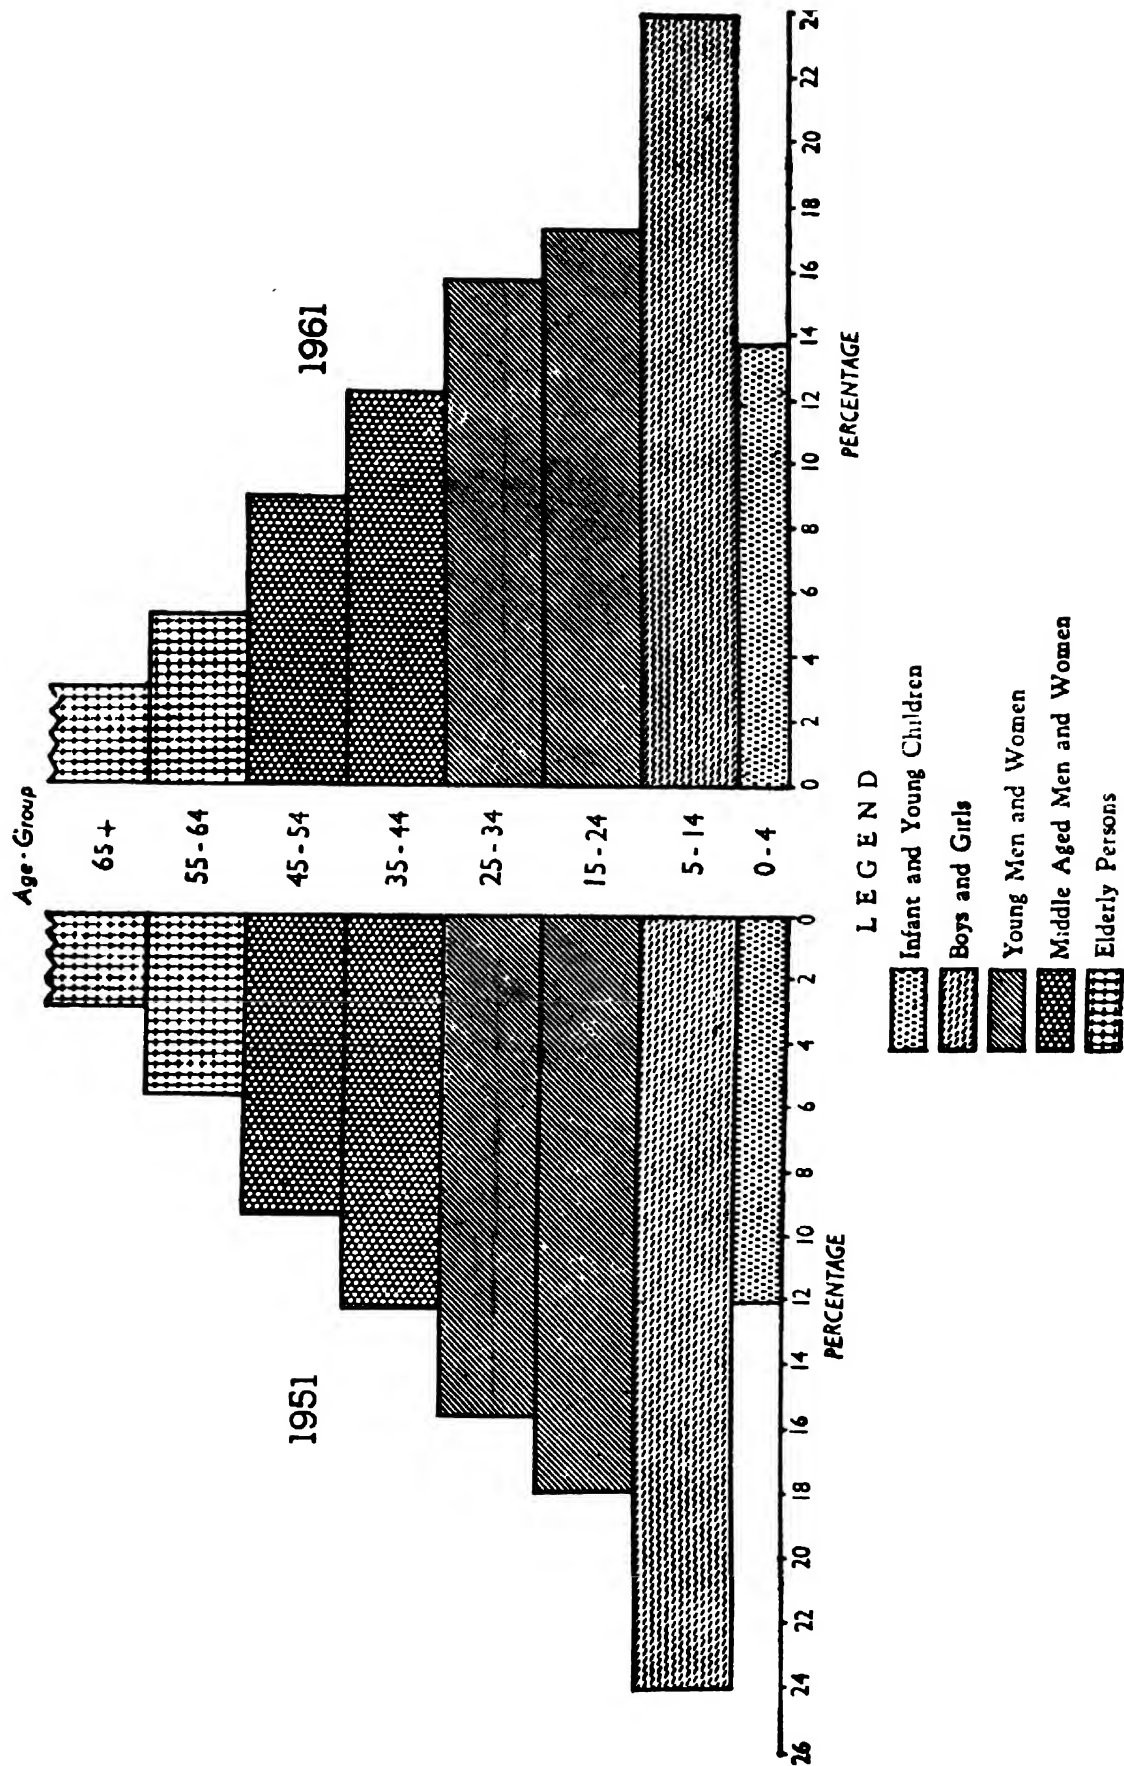

There has been a small decline in the proportion from 1951 to 1961 in all districts except Tiruchirapalli and Kanyakumari. In the case of Kanyakumari district, the proportion has increased slightly from 18.5 to 19.1 per cent and in Tiruchirapalli district, the proportion has been constant.

#### Elderly persons

The percentage of elderly persons, that is

# AGE PYRAMID (1951 & 1961)

persons of the age 55 and above are given below for 1951 and 1961.

	1961	1951
<b>State</b>	8.3	8.5
Madras	6.2	8.4
Chingleput	8.4	8.6
North Arcot	8.8	8.4
South Arcot	8.5	8.2
Salem	8.5	8.4
Coimbatore	8.7	8.8
Nilgiri	4.9	7.8
Madurai	7.3	7.3
Tiruchirapalli	8.6	8.7
Thanjavur	8.5	8.3
Ramanathapuram	8.3	9.2
Tirunelveli	9.5	9.5
Kanyakumari	8.4	7.6

For the State as a whole there has been a slight decline in the proportion of elderly persons. In Madras City and Nilgiri a marked decrease is noticed. In Kanyakumari, however, the proportion has increased from 7.6 to 8.4 per cent.

• The only group in which the proportion has increased during the decade 1951-60 is infants and young children. In all other groups, the proportion has gone down.

### Mean age

The mean age calculated for the population in the area constituting the present Madras State is given below for 1951 and 1961.

Year	Persons	Mean age	
		Males	Female
1951	25.43	25.46	25.41
1961	24.93	25.07	24.79

The mean age has shown a slight decline from 1951 to 1961. Both in 1951 and 1961, the mean age for males is higher than that of females.

### Vital Statistics

6. In Part I-B entitled "Demography and Vital Statistics", an analysis of age structure in Madras State has been made. An estimate of the birth and death rates has also been made

in that volume. This estimate is based on the Census age data for 1921, 1931, 1941, 1951 and 1961 adjusted for boundary changes. As the detailed methodology adopted for the estimation is given in that volume, it will be sufficient to give the results only here. The estimates of birth and death rates for Madras State for the past four decades are as follows.

Period	Growth rate	Birth rate	Death rate
1921-30	8.6	42.8	34.2
1931-40	11.4	41.1	29.7
1941-50	15.4	35.8	20.4
1951-60	11.2	34.9	23.7

There has been a progressive decline in the birth rate. In working out the death rate, the net outmigration from the State has not been taken into consideration. Assuming that the net outmigration is of the order of 4% in the decade, the death rate will be 19.7 per mille which is lower than the death rate for 1941-50. Actually, considering that in 1941-50 there has been a net addition to the population of the State by in-migration, the death rate of 20.4 is lower than the actual death rate of the decade. Thus the observed phenomenon is a constant decrease in the death rate which is in keeping with the general trend expected in the country.

### Age pattern

7. It is customary to classify population as "young" if they have less than 4 per cent of persons above 65 years, as "mature" when this percentage is between 4 and 7 and as 'aged' when it exceeds 7 per cent. It is observed that a major proportion of world population may be regarded as 'young or mature' and only a very small proportion as 'aged'. Madras State has a fairly 'young' population whereas economically advanced countries like Western Europe, U.S.A., Canada and Oceania have 'aged' population.

Table VIII-3 gives the trends in the percentage distribution of population in the present Madras State from 1901 to 1961. We find that the percentage in the age-group 0-14 has declined from 39.7 in 1901 to 37.6 in 1961. The trend has not been uniform throughout. There was

TABLE VIII — 3  
*Percentage distribution of population of present Madras State by broad age-groups*

Year	Males Age-group			Females Age-group			Total Age-group		
	0-14	15-59	60+	0-14	15-59	60+	0-14	15-59	60+
1	2	3	4	5	6	7	8	9	10
1901	40.5	54.1	5.4	39.0	55.2	5.8	39.7	54.7	5.6
1911	38.5	55.8	5.7	37.2	56.8	6.0	37.8	56.3	5.9
1921	37.8	56.3	5.9	37.0	57.1	5.9	37.4	56.7	5.9
1931	39.3	56.0	4.7	38.2	57.3	4.5	38.8	56.7	4.5
1941	39.1	56.4	4.5	38.4	57.0	4.6	38.7	56.7	4.6
1951	36.2	58.3	5.5	36.2	58.1	5.7	36.2	58.2	5.6
1961	37.7	56.7	5.6	37.5	56.9	5.6	37.6	56.8	5.6

a decline in the percentage upto 1921 followed by a slight increase in 1931 and 1941. In 1951 there was again a decline and the year 1961 witnessed a slight increase in the percentage. Similar trends are noticed for either sex.

The working age-group 15 to 59, contained 54.7 per cent of the population in 1901. A more or less steady proportion (around 56 per cent) was maintained from 1911 to 1941. In 1951, there has been an increase to 58.2 per cent and in 1961, it has again fallen to 56.8 per cent. The old age-group has remained more or less same throughout (around 5.6 per cent) except during 1931 and 1941 when it was around 4.5 per cent.

A comparison of the percentages in 0-14 in 1921 and 1931 shows that an increase has been registered during this period as an aftermath of the influenza epidemic during the period 1921-31.

The only plausible explanation to the steep fall in the proportion of aged persons between 1921 and 1931 is that the toll of influenza epidemic should have been particularly heavy among persons aged 50 and over. This age-group has in particular a limited resistance against diseases and epidemics.

The changes in age pattern between 1921 and 1961 may be briefly explained as follows.

1. Between 1921 and 1931 there was a reduction in mortality without any change in fertility.

2. Between 1931 and 1951, there has been a reduction in fertility with little change in mortality.

3. Between 1951 and 1961 there has been a reduction in mortality with little change in fertility.

## SECTION II

### SEX

8. The last item in the individual slip (Q. 13) related to the sex of the individual. The symbols 'M' and 'F' were recorded for males and females respectively. Eunuchs and Hermaphrodites were recorded as males.

#### Sex Ratio

9. Usually one would expect that males and females are equal in number. When the Census figures show a different trend, it is viewed with some surprise. The Census figures not only

show that males and females are unequal in numbers, but also that the degree of disparity changes from place to place and age to age.

It is customary to measure the difference in numbers between the sexes by an index number called the sex ratio. In the United Kingdom, the sex ratio is calculated as 'the number of females per 1,000 males'. In the United States,

'the number of males per 1,000 females' is called the sex ratio. In our Census, as in U. K., sex ratio is meant 'the number of females per 1,000 males'.

Table VIII-4 gives the sex ratio and proportion of population of each sex in age-groups 0-14, 15-49 and 50+ for India and the different States and Union Territories, U. S. A., U. K., France and Japan.

TABLE VIII — 4

*Population of each sex in age-groups expressed in terms of percentage to total population of each sex*

State/Union Territory/ Country	Females per 1,000 males	Age-groups						Age Not Stated	
		0-14		15-49		50+

United Kingdom	1,068	24.37	21.75	48.15	45.24	27.48	33.01		
France	1,085	26.80	24.42	46.52	42.62	26.68	32.95		
Japan	1,036	31.14	28.94	52.19	53.07	16.67	17.99		

\* The classification of 297,853 persons (M-147,100 F-150,753) of N.E.F.A. into various age-groups is not available. Therefore, these figures have not been taken into account while working out the distribution into various age-groups for N.E.F.A. and India.

# Male and Female Population by Age-Groups 961

One striking feature of the above table is that whereas the sex ratios in U. S. A., U.K., France and Japan are above 1,000, the sex ratio in India is below 1,000. In other words, females are fewer than males in India whereas the opposite trend is noticed in western countries. In Madras State, the sex ratio (992) is more than the country's average. In fact, among States barring Kerala and Orissa, the sex ratio in all the States is less than 1,000.

#### Sex and age

10. For the purpose of comparison of the distribution of population into various age-groups the following statement may be studied.

Age-group	India		Madras State	
	Males	Females	Males	Females
1	2	3	4	5
0-14	40.92	41.14	37.75	37.46
15-49	47.20	47.13	49.56	50.25
50+	11.84	11.69	12.68	12.28
A.N.S.	0.04	0.04	0.01	0.01

As regards males in the age-group 0-14, the proportion is higher in India than in Madras State. In the age-groups 15-49 and 50+, the opposite trend is observed. The same pattern is noticed in respect of females also. In both Madras State and India, the difference in proportion between males and females in each age-group is not considerable. Yet a pattern is observed in the differences. In the age-group 0-14, the proportion of females is higher than males in India and the proportion of males is higher than females in Madras State. In the age-group 15-49, the proportion of males is higher than females in India whereas the proportion of females is higher than males in Madras State. In the ages 50+, in both India and the State, the proportion of males is higher than females.

In Table VIII--5 is given the distribution of 1,000 persons of each sex by age-groups and sex ratio in each age-group in the State as well as in the districts.

a=Ratio of males in that age-group to total of 1,000 males in all age-groups

b=Ratio of females in that age-group to total of 1,000 females in all age-groups

c=Number of females per 1,000 males in each age-group

N=Denotes negligible figures

On the basis of the above Table, it will be interesting to examine the following conclusions drawn by the Superintendent of Census Operations, West Bengal for 1951.

- “(a) A larger proportion of boys than girls seems to be born in this country than in western countries.
- (b) Girls in the first few years of their life still seem to suffer from comparative neglect than boys, as a result of which Nature’s balancing action of taking away more boys than girls in the first years of life does not properly come into play and the survival of girls never seems to draw even with the survival of boys.
- (c) A very heavy toll of female lives is taken in the earlier period of the reproducing ages, that is between the ages of 15-34. The toll is so heavy that the difference between the male and female population grows remarkably rapid and wide and this gap is never made up in middle or old age.
- (d) Proportionately greater deaths occur among females even between the ages 35-54 than is usually imagined”.

The above conclusions are dealt with below seriatim.

(a) In Madras State, the sex ratio at birth during the decade 1951-60 works out to 937. It is therefore, obvious that the first conclusion holds good for the State.

(b) Upto the fourth year of age, the sex ratios are as follows in Madras State.

Age	Sex ratio
0	1,013
1	993
2	972
3	1,016
4	982

The second conclusion may not wholly hold good for the State in view of the fluctuations in sex ratio observed.

(c) Between the ages 15-34, the sex ratios are as follows:

Age-group	Sex ratio
15 — 19	983
20 — 24	1,034
25 — 29	1,096
30 — 34	1,025

The third conclusion may not also hold good for the State in view of the sex ratio being above 1,000 between 20 and 34.

(d) Following are the sex ratios between the ages 35 and 54.

Age-group	Sex ratio
35 — 39	948
40 — 44	911
45 — 49	907
50 — 54	957

The depressingly low sex ratios in the age-groups 40-44 and 45-49 go to prove that proportionately greater deaths occur among females than males in these ages.

An abstract Table showing the proportion of both the sexes in different ages and age-groups for the State with rural-urban break-up is given below:

TABLE VIII — 6

TABLE VIII — 6 (Contd.)

*Proportion per thousand of population of each sex by age-groups*

Age-group	Total		Rural		Urban	
	Males	Females	Males	Females	Males	Females
1	2	3	4	5	6	7
20 - 24	84	93	81	91	91	98
25 - 29	82	91	80	89	87	95
30 - 34	69	72	67	71	75	73
35 - 39	67	64	67	66	69	62
40 - 44	58	53	57	54	60	50
45 - 49	50	45	51	47	47	40
50 - 54	42	40	43	42	40	37
55 - 59	29	27	30	28	24	23
60 - 64	26	26	27	26	22	24
65 - 69	13	12	14	13	10	10
70+	17	18	19	19	14	16
A.N.S.	...	...	...	...	...	...

### Males

The proportion decreases with the increase age. The group 70+ which includes all ages above 70 has, however, a proportion higher than that of 65-69. Among children in the group 0-4, the proportion decreases from 0 to 1 and then increases to 30 at ages 2 and 3 and again decreases to 26 at the age 4. The proportion of children in the age-group 0-4 is higher in rural areas than in urban areas.

In the rural sector also, the proportion decreases with the increase in age. In the urban sector, a similar trend is observed but for a spurt in the age-group 20-24. There is a fall in the proportion from the age-group 10-14 to 15-19 and the proportion increases to 91 in the age-group 20-24 and then decreases to 87 in the age-group 25-29. In rural as well as urban areas, the decrease in proportion from the age-group 10-14 to 15-19 is considerable.

### Females

The proportion of females in both rural and urban areas decreases with increase in age but for a rise from the age-group 15-19 to 20-24. The

fall in proportion from the age-group 5-9 to 10-14 is more in respect of females than males. The proportion of female children in the age-group 0-4 is more than that of males in urban areas. But in rural areas, the proportion of males is slightly higher than that of females. Among children in the age-group 0-4 as in the case of males, the proportion decreases from age 0 to 1 and then increases at ages 2 and 3 and then decreases at age 4.

### Sex ratio in districts

11. The sex ratios in the districts are given in Table VIII-7 for all areas, rural areas and urban areas.

TABLE VIII — 7

*Sex ratios in State and districts*

District	Sex ratio in		
	Total	Rural	Urban
1	2	3	4
State	992	1,003	963
Madras	901	...	901
Chingleput	960	966	938
North Arcot	989	990	986
South Arcot	984	986	973
Salem	977	980	962
Coimbatore	966	981	930
Nilgiri	914	923	902
Madurai	998	1,011	971
Tiruchirapalli	1,008	1,019	971
Thanjavur	1,016	1,019	1,004
Ramanathapuram	1,060	1,066	1,042
Tirunelveli	1,053	1,058	1,041
Kanyakumari	979	978	987

In the districts of Tiruchirapalli, Thanjavur, Ramanathapuram and Tirunelveli, there is an excess of females and this excess is more pronounced in Ramanathapuram and Tirunelveli districts. An obvious conclusion that can be arrived at from these figures is that it is likely that males emigrate in good numbers leaving females behind. Ramanathapuram which has the highest sex ratio (1,060) perhaps sends more men to other places. In Nilgiri district, the sex

ratio is low (914). The immigrant population in this hill district is predominantly male and this accounts for the low sex ratio. In this district, the sex ratio has increased from 858 to 914 during the period 1941-61, presumably because the labourers who settle down in the plantations for work bring their families also gradually. In Madras City, the chief place of immigration of menfolk, the sex ratio is the

lowest with 901. The figure which has increased from 908 in 1941 to 921 in 1951 has decreased to 901 in 1961. As is to be expected, the sex ratio in rural areas is higher than that in urban areas. The only exception is the Kanyakumari district. The reason for this peculiar feature in Kanyakumari district may be that the towns in this district are mostly residential rather than industrial.

TABLE VIII — 8  
*Sex ratio at birth and death*

District	Number of females per 1,000 males in the general population	Average No. of female births to 1,000 male births during the decade	Average of female deaths to 1,000 male deaths during the decade

Thanjavur	1,016	939	1,012
Ramanathapuram	1,060	925	998
Tirunelveli	1,053	941	1,001
Kanyakumari	979	927	940

#### Sex ratios at birth and death

12. The table VIII - 8 gives the sex ratios at birth and death for the State and districts for the decade 1951-60.

As may be seen from the above Table, in the State the number of females living per 1,000 males is more than those born or dying per 1,000 males. In Madras City and Nilgiri, however,

a different trend is observed — the general sex ratio is less than the sex ratios at birth and death.

The changes in the sex ratio in the State during 1901-61 may be observed from Table VIII-9. The figures given in the table are taken from the volume—Census of India Paper No. 2 of 1963, Age Tables. Following points

have to be taken into account in respect of this Table:

1. The sex ratio shown against 60-64 under 1901 relates to the age-group 60 and over.

2. The data relate to State as constituted on the date of the relevant census, and not to the

1961 lay out of the State.

3. The ratios up to and including 1931 are based on the unadjusted group totals as published in the relevant Census Report, but those for 1941 and 1951 are given for adjusted group totals corrected for age bias.

TABLE VIII — 9  
*Sex ratio (per 100 males) during 1901-1961*

Age-group	Census year						
	1901	1911	1921	1931	1941	1951	1961
1	2	3	4	5	6	7	8
0 - 4	95.1	96.3	95.8	96.7	99.3	99.6	100.8

## SECTION III

### MARITAL STATUS

#### General

13. In this section, I propose to discuss marital status, another significant information relating to the individual. The instructions issued in recording marital status are reproduced below :

“Question 3 — Marital Status:—

Marital Status of every person whether the individual be an adult or an infant has to be recorded. The answers are to be recorded in the form of abbreviations. A person should be treated as never married only if he has not at any time entered into the state of matrimony. A person who is married once and has lost his wife or obtained a divorce and is staying single should not be recorded as a married person. A person should be regarded as married if he is recognised by custom or society to be a married person or has been married in accordance with any religious rites or by registration or according to any custom or form of marriage recognised by his community or is in stable *de facto* union and has not been widowed or divorced. A person should be regarded as widowed if he or she has lost his or her spouse by death but has not remarried. A person is said to be divorced who after marital ties have been severed by law or custom, either social or religious or by mutual consent, has never been remarried. A person who has been separated from wife or husband and is living apart with no intention of living together again should be regarded as separated. In the case of prostitutes return her marital status as declared by her. The following abbreviations should be used while recording the answers :

NM — Never married ; M — Married ; W — Widowed ; S — Divorced or separated.”

Never married can be recorded easily and no error is likely to creep in. Marriage does not necessarily signify legality. *De facto* unions have been recognised in Indian Census as legal marriage. The concept of separated or divorced is not clearly understood in Indian society. Further for reasons of respectability, the divorced or separated status is not readily admitted by the

people with the result there is likely to be under-recording under this head. Another interesting aspect of Madras State is that self-respect marriages conducted by Dravida Kazhagam were not legally recognised and not treated as such during 1961 Census. But after the Census was taken, the State has declared such marriages as legally valid. But the percentage of error in recording this information is much less than under other heads.

#### Distribution of population by civil condition

14. The table (VIII-13) gives the percentage of unmarried, married, widowed and divorced or separated persons by sex according to the 1961 Census.

In the State, 55.4% of males and 43.3% of females are never married. 41.0% of males and 43.0% of females are married. The percentage of widowed persons among females is four times that of males, the figure being 3.2% for males and 12.8% for females. This can be easily explained by the fact that widowed men find it much easier to get married than widowed women. The divorced or separated persons among males is actually less than 0.5% while it is 0.9% for females. In the case of females, it is likely to be an under-estimate, because divorced or separated persons do not always admit their status easily during enumeration.

The percentage of never married males varies from 54 in South Arcot to 62.6 in Kanyakumari. Madras and Nilgiri have also recorded higher figures of 58.3% and 57.9%. Figures of never married females range from 41.1% in South Arcot to 52.5% in Kanyakumari. Higher percentages have also been recorded in Nilgiri, Kanyakumari and South Arcot which stand out prominently in this pattern. Percentage of married males varies from 34.9 in Kanyakumari to 42.1 in South Arcot. Madras and Nilgiri, (39.4% and 39.8%) have lower married proportion among males. Among married females, the range is from 36.5% in Kanyakumari to 44.6% in South Arcot. Tirunelveli with 41.7%,

TABLE VIII — 13  
*Distribution of males and females by civil condition*

State/District	Males				Females			
	Never Married	Married	Widowed	Divorced or Separated	Never Married	Married	Widowed	Divorced or Separated
1	2	3	4	5	6	7	8	9
<b>Madras State</b>	<b>55.4</b>	<b>41.0</b>	<b>3.2</b>	<b>0.4</b>	<b>43.3</b>	<b>43.0</b>	<b>12.8</b>	<b>0.9</b>
Madras	58.3	39.4	2.1	0.2	44.9	43.6	11.0	0.5
Chingleput	55.2	41.6	3.0	0.2	42.1	44.3	13.1	0.5
North Arcot	55.4	41.3	2.9	0.4	42.3	43.9	13.0	0.8
South Arcot	54.0	42.1	3.5	0.4	41.1	44.6	13.8	0.5
Salem	54.4	41.9	3.0	0.6	43.3	44.4	11.1	1.2
Coimbatore	55.3	40.9	3.3	0.5	44.8	42.7	11.3	1.2
Nilgiri	57.9	39.8	1.7	0.6	49.0	42.3	7.6	1.1
Madurai	55.3	40.8	3.2	0.7	44.0	42.0	12.6	1.4
Tiruchirapalli	54.4	41.5	3.6	0.5	41.4	42.8	15.0	0.8
Thanjavur	55.0	41.3	3.4	0.3	41.5	43.4	14.5	0.6
Ramanathapuram	55.4	40.7	3.4	0.5	43.2	42.4	13.5	0.9
Tirunelveli	55.6	40.7	3.3	0.4	44.6	41.7	12.9	0.8
Kanyakumari	62.6	34.9	2.2	0.3	52.5	36.5	10.2	0.8

Madurai with 42% and Nilgiri with 42.3% have higher figures. Kanyakumari and South Arcot represent the extremes. The percentage of widowers ranges from 1.7 in Nilgiri to 3.6 in Tiruchirapalli. South Arcot has recorded a higher figure of 3.5%. The percentage of widows ranges from 7.6 in Nilgiri to 15 in Tiruchirapalli. Thanjavur (14.5%) and Kanyakumari (10.2%) have also recorded higher and lower figures. The percentage of widows is much higher than the percentage of widowers. Divorced or separated males show a percentage of 0.7 in Madurai. It is as low as 0.2% in Madras and Chingleput.

Among females, Madurai has shown the highest figure, 1.4% and Madras, Chingleput and South Arcot the lowest, 0.5%; Salem, Coimbatore and Nilgiri have shown proportions above 1%.

#### Changes in the pattern of civil condition 1921—61

15. It will be interesting to study the pattern of the percentage of population under each civil condition from decade to decade since 1921. The following table extracted from Subsidiary Table C II-2 gives the proportion of unmarried males and females in the State and districts for every 1,000 persons of each sex.

TABLE VIII — 14  
*Proportion of never married persons per 1,000 of each sex, 1921—61*

State/District	Males					Females				
	1961	1951	1941	1931	1921	1961	1951	1941	1931	1921
1	2	3	4	5	6	7	8	9	10	11
Madras State	554	546	578	543	538	433	427	468	406	393
Madras	583	480	548	510	491	449	373	422	367	348
Chingleput	552	554	581	559	550	421	433	439	417	398
North Arcot	554	562	563	548	544	423	425	432	407	397
South Arcot	540	537	561	540	535	411	399	411	391	377
Salem	545	527	551	539	537	433	441	434	415	402
Coimbatore	553	550	564	546	537	448	448	449	430	406
Nilgiri	579	542	544	537	537	490	377	430	454	429
Madurai	553	545	559	542	537	440	438	427	412	404
Tiruchirapalli	544	541	553	539	534	414	411	396	384	379
Thanjavur	550	543	550	534	529	415	395	399	376	367
Ramanathapuram	554	543	552	538	534	432	426	419	405	390
Tirunelveli	556	552	556	547	545	446	445	436	415	407
Kanyakumari	626	628	586	602	586	525	505	485	468	470

The period 1921-61 has witnessed an increase in the proportion of unmarried males. It is particularly marked in Madras City followed by Nilgiri and Kanyakumari. During 1951-61, Madras and Nilgiri have also recorded a good increase in the proportion. North Arcot, Chingleput, and Kanyakumari have recorded insignificant decreases during this period. Generally all districts have recorded increases in the proportion during the period 1921-61 thereby indicating that males hesitate to shoulder the responsibility of married life. Similar is the trend

in the proportion of unmarried females for the period 1921-61, increase being recorded in all the districts. The increases in Madras, Coimbatore, Thanjavur, Ramanathapuram, Nilgiri and Kanyakumari are marked. Also the increase is more than that of males in almost all the districts indicating the emergence of women as an important force in the social life. The districts of Chingleput, North Arcot and Salem have shown decreases in 1961 over 1951 figures.

The increase in the proportion of never married males and females during the last four decades

can be attributed in general to the rise in the age of marriage. Education and forces like Child Marriage Restraint Act have accelerated this change. Again, the desire of the married couple to live on their own, independent of the family has made it almost compulsory to remain unmarried for longer periods. The high cost of living prevalent after World War II has tempted women to work thereby augmenting the family income. This tendency has been accelerated

by the rise in the literacy level of women. Today the educated women compete with men for many jobs and the Constitution has guaranteed them equal rights which makes it possible for them to be gainfully employed. Again, the income has less value and as such the tendency for late marriage is pronounced.

The table below exhibits the proportion of married persons per 1,000 of each sex during the period 1921-61.

TABLE VIII — 15  
*Proportion of married persons per 1,000 of each sex, 1921-61*

State/District	Males					Females				
	1961	1951	1941	1931	1921	1961	1951	1941	1931	1921

Among males there is a decrease in the married proportion during the period 1921-61 at the State level and in all districts except Chingleput and Salem. A small increase has been recorded

in Chingleput while in Salem no change has been recorded. The decrease during 1951-61 at the State level is also not significant. A decrease has been recorded in the districts of Madras, Nilgiri and

Kanyakumari during the period 1921 - 61. During 1951 - 61 there is an increase in the proportion in Chingleput, North Arcot, Coimbatore, Tiruchirapalli and Tirunelveli. The increase is not marked in Tirunelveli and Tiruchirapalli. In other districts, the increase is higher. The decrease in the proportion in Madras and Nilgiri is rather high during 1951-61. At the State level, the decrease in the proportion of married females during 1921-61 is not much and is less than the decrease noticed under males. No significant change can be seen at the State level. The districts of Madras, Coimbatore,

Nilgiri, Madurai, Tiruchirapalli, Ramanathapuram, Tirunelveli and Kanyakumari have shown decreases during the period 1921 - 61. During 1951 - 61, the districts of Madras, Madurai, Nilgiri and Thanjavur have shown a higher decrease. In Nilgiri the decrease is very high. Chingleput, North Arcot, Salem, Tiruchirapalli and Tirunelveli have shown increases during 1951-61. The increases in Chingleput and Tiruchirapalli are marked.

The proportion of widowed persons including divorced or separated per 1,000 of each sex is given in the Table below:

TABLE VIII — 16  
*Proportion of widowed persons per 1,000 of each sex, 1921-61*

State/District	Males					Females				
	1961	1951	1941	1931	1921	1961	1951	1941	1931	1921

<b>South Arcot</b>	39	37	42	38	40	143	156	165	174	181
<b>Salem</b>	36	40	42	37	44	123	122	135	155	170
<b>Coimbatore</b>	38	47	38	41	44	125	123	135	153	161
<b>Nilgiri</b>	23	31	33	31	35	87	76	107	118	125
<b>Madurai</b>	39	42	43	40	43	140	133	152	165	171
<b>Tiruchirapalli</b>	41	46	47	41	41	158	173	182	195	191
<b>Thanjavur</b>	37	42	44	45	47	151	159	179	200	208
<b>Ramanathapuram</b>	39	48	48	43	46	144	145	158	172	177
<b>Tirunelveli</b>	37	42	41	40	42	137	144	156	161	164
<b>Kanyakumari</b>	25	23	27	30	35	110	121	130	143	140

Both the sexes have shown lower proportions in 1961 than in the earlier period 1921. The decrease is fairly high in all the districts. This may be mainly due to the general improvement in the health conditions of the population. To a small extent the decrease under females can be attributed to widow remarriages now becoming more common than in the earlier period when such marriages were viewed with displeasure. The highest proportion of widows is seen in Tiruchirapalli and Thanjavur districts which are stagnant in their growth, but even in these districts, a decrease has been noticed from 1921 to 1961. Low proportions of widows and widowers in Nilgiri, noted for migrant population can be attributed to the fact that widows will not

generally migrate and widowers cannot migrate leaving their children behind.

The decrease of widowers and widows in 1961 over the 1951 figure in Madras seems strange. Sri Venkateswaran in his 1951 Report has attributed the large proportion of widows as inward movement for education and employment. From the figures of 1961 it is rather difficult to say whether this trend has been reversed.

#### **Marital Status of the population by age-groups**

16. The table below presents the distribution of 1,000 persons in each sex by marital status for the State and districts. The number of females per 1,000 males in each age-group and marital status are also given.

TABLE VIII — 17

	S	22	...	...	16	9	500	13	...	...

N.M — Never Married; M — Married; W — W. lowed; S — Divorced or Separated; N denotes negligible figures.

(a) Males per 1,000 males at each age-group by category of marital status.

(b) Females per 1,000 females at each age-group by category of marital status.

(c) Females per 1,000 males in each age-group by each marital status.

The age-groups 0-9 and 10-14 normally form a never married group. In the latter age-group however, a small percentage of females (2.4%) are married as against only 0.4% of males. This shows that marriage below the age of 15 still takes place inspite of the provisions of Child Marriage Restraint Act. North Arcot (6.1%) South Arcot (4.4%), Salem (4.4%) and Nilgiri (3.4%) have shown higher figures among females than the State.

In the age-group 15-19, only 3% of males are married while 97% are unmarried. About two fifths of the females are married. Kanyakumari, Madras and Tirunelveli have shown much lower percentage of married among males while Salem has shown over 5%. In North Arcot and South Arcot, percentage of married females is over 60% while in Salem it is 51.7%. Coimbatore, Ramnathapuram, and Tirunelveli show lower percentages ranging between 25 and 32. Kanyakumari has shown the lowest figure of 13.7%. In this age-group for most districts marriage has become the formal pattern among females.

In the age-group 20-24, 28.6% of males and 86.5% of females are married. The married proportion among females is twice that of the earlier age-group. Approximately about three-fourths of males are still unmarried as against one tenth of females. Madras and Kanyakumari record much lower figures under married among males and females. Salem shows the highest (39.0%) under married males. In the districts of Chingleput, North Arcot, South Arcot, Salem and Thanjavur, more than 90% of the females are married.

For males, the age-group 25-29 exhibits a sharp increase over the figures in the earlier age-period (i.e.) from 28.6% to 70.6% married. Females who are married have also shown an increase but it is not very significant (86.5% to 92.9%) when compared to the increase shown by males. In this age-group, the highest percentage of married females can be seen (92.9%). Madras and Kanyakumari have shown much higher percentages of never married in both the sexes while Salem the lowest percentage. Widowed category makes its appearance in this age-group with a percentage of 1.1 for males and 3.3 for females. Tiruchirapalli's figure (4.1%) for widows is significant.

In the age-group 30-34, the proportions of males and females under married is almost equal (M-88.1%, F-89.3%). While a sizable increase under males is seen there is a small decrease under females. Widowed among females emerges clearly in this age-group with a percentage of 7.9. Tiruchirapalli's 9.9% under widowed females is significant. Madras, Nilgiri and Kanyakumari have shown higher figures under never married among males with more than 10%.

92.6% of males and 84.1% of females are married in the age-group 35-39. Highest proportion of married males is seen in this age-group. Married proportion for females continues the decreasing trend exhibited in the earlier age-period (from 89.3% to 84.1%). Widowed proportion among females has increased from 7.9% in 30-34 to 13.4% in this age-group. Madras and Nilgiri show much higher figures under both the sexes in the unmarried category. Chingleput records the highest percentage of 7% under unmarried males. Widowed proportions are highest under both the sexes in Tiruchirapalli (M-3.5% F-16.5%). South Arcot also exhibits higher percentages under this category. Kanyakumari and Nilgiri exhibit lower figures in both the sexes for widowed.

Even though the age-group 40-44 is also a predominantly married one (92.1% of males and 72.6% of females are married) one can see the decrease in their proportions from the earlier age-period, particularly among females. Widowed category both among males and females show increases over the proportions in the earlier age-period. Roughly one fourth of females are widows and only one twentieth of males are widowed. For every widower there are about five widows in this age-group. The widowed proportions in Nilgiri and Kanyakumari are much lower while in Tiruchirapalli it is much higher.

A slight decrease (1.3%) under males in the married category is noticed in the age-group 45-49 while there is a good decrease of 8.5% under females over the percentage in the 40-44 age-group. The married proportions are males-90.8% and females-64.1%. The decrease is more than compensated in the increase in both the sexes under "widowed", the proportions being (M-40-44 - 4.5%, 45-49 - 6.4%, F. 40-44 - 24.8%, 45-49 - 33.8%). Over one third of the females of this age-group are widows. The proportions

are significantly on the higher side in the districts of Madurai, Tiruchirapalli and Thanjavur and on the lower side in Nilgiri and Kanyakumari for both the sexes. Salem and Coimbatore have also exhibited lower percentages for females.

In the age-group 50-54, the proportion of married females decreases from 64.1% in the age-group 45-49 to 48.1%. Among males the decrease is not much (3.5%) but higher than the decrease seen in the earlier age-group (1.3%). Widowed category assumes prominence accounting for 50.1% of female population. About one tenth of males are widowers in this age-period. Among females, percentage of widows is significantly higher in Madras, South Arcot, Tiruchirapalli and Thanjavur and much lower in Salem, Coimbatore, Nilgiri, Tirunelveli and Kanyakumari.

Gradual decrease under married and an increase under widowed is seen for males in the age-group 55-59. The decrease is 7.8% for married females. The increase under widowed is 8.1%. About three fifths of females belonging to this age-group are widows, while about one eighth of males are widowers. The percentage of widows ranges from 63 to 67% in the districts of Madras, South Arcot, Tiruchirapalli and Thanjavur. Salem and Coimbatore have recorded much lower percentages (50 and 49). Kanyakumari has shown lower figures in both the sexes.

While the proportion of married males gets reduced by 5.5% in the age-group 60-64 from the age-period 55-59, females show a decrease of 15.6%. About three fourths of the females in this age-group are widows while four fifths of the males are married. Widowed males record a percentage of 18.8% in this age-group. A corresponding increase is seen under widowed in both the sexes with a decrease under married from the proportion recorded in the earlier age-group. Nilgiri and Kanyakumari show lower percentage figures in both the sexes under widowed while Tiruchirapalli and Thanjavur have shown higher figures. Ramanathapuram has shown the highest percentage of 21.3 under males who are widowed.

75.2% males and 20.3% females are married in the age-group 65-69. 22.8% of males and 78.5% of females are widowed. It is interesting to note the reversal of proportions in the two civil conditions for the sexes. Nilgiri and Kanya-

kumari have shown much lower figures under widowed. Ramanathapuram has shown the highest percentage of 25.4% for widowed males and Thanjavur under females (86.3%). South Arcot's 84.4% under widowed for females is also to be noted.

In the age-group 70+ even though married category is the predominant one among males more than one third of males are widowers. Among females, 89.3% are widows and only about one tenth are married. While Ramanathapuram shows the highest proportion of widowed among males, Thanjavur shows the highest proportion among females.

The diagram below shows the civil condition of the sexes by age-groups for the State as a whole. The much greater proportion of widows and much greater proportion of married males are the significant points. Early marriages to husbands much older and the general discouragement of a second marriage in a predominantly Hindu Society, have produced inevitably a large proportion of widows. The disproportion begins early, that is, from the age-group 30-34 and rises to such high proportions as 50% in the age-group 50-54. About one eighth and one fourth of females in the age-group 35-39 and 40-44 respectively are widows, the corresponding proportions for males being 2.6% and 4.5% respectively. Even in the age-group 60-64 the male proportion does not exceed 20%.

One can also see the married proportion clearly in the age-group 10-14 for females. The marriage for females begins in their late teens (15-19) where 43.2% are married and doubles itself in the next age-group 20-24 and widowed category begins to show its appearance. Among males less than one thirtieth are married in the age-group 15-19 and about one third in 20-24 are so. For males the marriage rate is highest between 25-29 where 70.6% are married. For females, the access to matrimony is evenly spread over the periods 15-19 and 20-24. This also indicates that generally women are married to persons older than them and that early marriage is still a significant feature.

Divorced or separated category among males has almost the same proportion in most of the age-periods. Even among females fairly uniform proportions are to be seen in a number of age-

groups and gets reduced in the later age-groups. Divorced or separated category at the State level does not assume any high proportion for both the sexes.

The following are the proportions of males and females in the State by civil condition

	Males	Females
Never married	55.4%	43.3%
Married	41.0%	43.0%
Widowed	3.2%	12.8%
Divorced or Separated	0.4%	0.9%

From the above figures it may be seen that more than half the male population are unmarried as against two fifths of females. Married proportions are very nearly the same in both the sexes; but widows form nearly four times the proportion of widowers.

#### Marital status by broad age-groups

17. Table VIII-18 gives the marital status by broad age-groups.

TABLE VIII — 18

N — denotes negligible figures

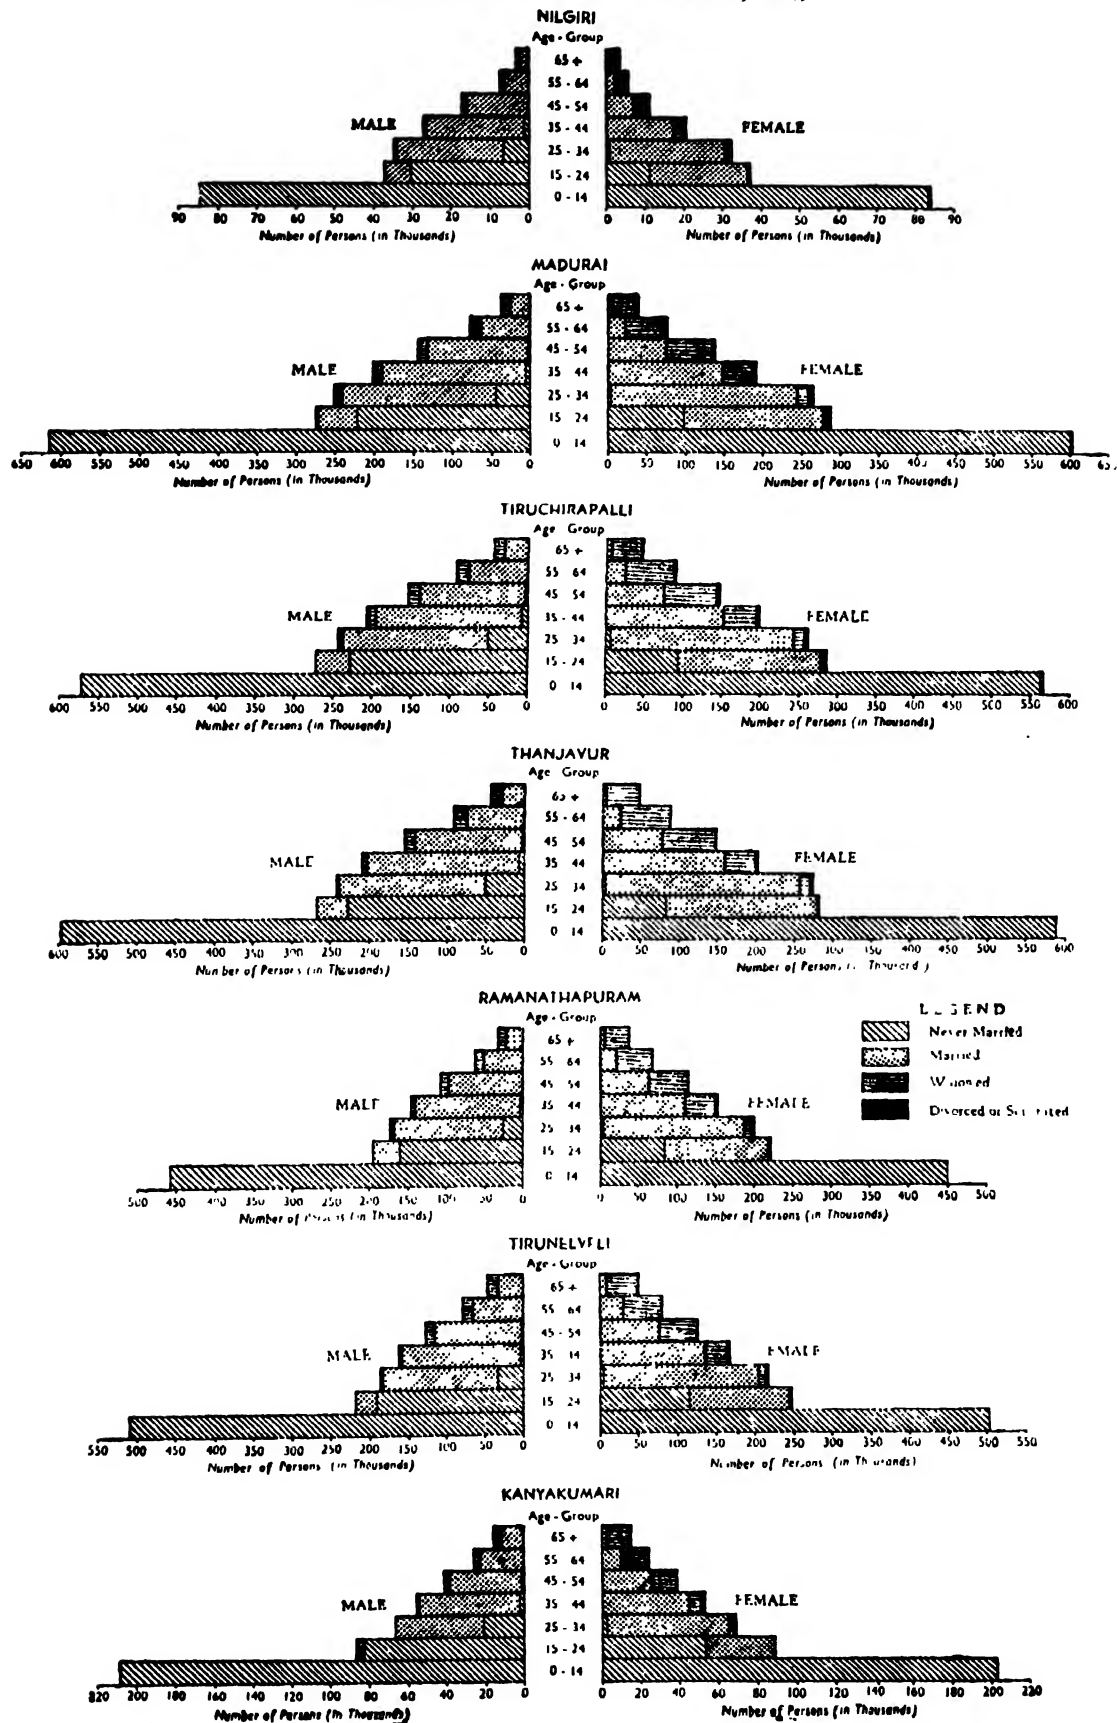

# AGE PYRAMIDS BY MARITAL STATUS, 1961

# AGE PYRAMIDS BY MARITAL STATUS, 1961.

0-14 is predominantly an unmarried age-group for both the sexes. This trend is seen in all the districts. But this does not mean that marriages in this age-group has not taken place. There are 51,489 married persons in this age-group in a total population of 12,667,171 which is not significant. While the proportion of married among males does not exceed 2 per 1,000 in any district, the proportion among females is more than 10 per 1,000 in the districts of North Arcot, South Arcot and Salem indicating the backwardness of these northern districts.

Among males of 15-34 age-group more than two-thirds remain single. Slightly more than half the males are unmarried (53.1%) while a slightly lesser proportion are married (45.5%). Salem is the only district which has shown more married males (50.8%) in this age-group. Madras and Kanyakumari exhibit the other extreme of having more than 60% under never married. Less than 1% are widowed in this age-group. For females, this age-group is essentially a married age-group in as much as 78.1% are married. About one thirtieth are widowed among females. Chingleput, North Arcot, South Arcot, Salem and Thanjavur show more than four-fifths under married. Tirunelveli and Kanyakumari have shown lesser proportions under married (Tirunelveli 70.9% and Kanyakumari 61.7%). Tiruchirapalli's widowed percentage is the highest (3.7%) and Kanyakumari and Nilgiri show lowest percentages under widowed for females.

The age-group 35-59 for males is mainly a married age-group just as 0-14 is an unmarried group for this sex. Nine-tenths are united in wedlock while only one fortieth remain single. About one sixteenth are widowers. Highest proportion of married males is to be seen in this age-group. North Arcot and Kanyakumari have exhibited the highest proportion under married, 92% and 92.2% respectively. Tiruchirapalli and Ramanathapuram show higher figures under widowed while Madras, Nilgiri and Kanyakumari show low figures. For females, we see a sizable decrease in the proportions of unmarried and married from the earlier age-period with a compensating increase under widowed. The proportion of widowed has increased from one

thirtieth in the age-group 15-34 to about one third in this age-period. South Arcot, Tiruchirapalli and Thanjavur have shown higher percentages under widowed females, while Kanyakumari, Salem, Coimbatore and Nilgiri have exhibited lesser proportions.

Even the age-group 60+ is predominantly married group for males in so far as about three fourths are married. About one fourth are widowers. Percentage figures in Nilgiri (19.4%), Tiruchirapalli (25.3%), Thanjavur (25.4%) Ramanathapuram (26.4%) and Kanyakumari (20.5%) for widowed are worth noting. North Arcot (77.3%), Nilgiri (78.0%) and Kanyakumari (77.7%) are to be noted under married as on the higher side. Among females nearly four-fifths are widowed and about one fifth are married. The widowed proportion for females reaches the zenith in this age-period. Figures in Madras (83.8%), South Arcot (84.4%), Nilgiri (72.1%), Thanjavur (86.3%) and Kanyakumari (76.6%) under widowed are considerable.

#### **Civil condition in the cities and town-groups of population one lakh and above by broad age-groups.**

18. 0-14 is preponderantly a never married age-group for both the sexes in all the cities and town-groups. Among females we find only a small proportion of married persons in all the cities except Salem. In Salem, the proportion for married females is 29 per 1,000 which indicates that in this town child marriage is still practised. It is also to be seen that the district of Salem has shown higher proportion in this group compared to other districts.

In most of the cities and town-groups the age-group 15-34 is predominantly a never married group for males, as over 53% are never married. In Salem city, it is seen that the married category becomes prominent with a percentage of 53.1% while never married shows 46.0%. Nagercoil has shown the highest percentage under never married compared to other cities and town-groups. In Thanjavur, Madras, Coimbatore and Tiruchirapalli also the never married males are over 60%.

For females, married category emerges as the most significant group, as in all the cities and town-groups more than 64% are married.

Barring Nagercoil, the range for the other cities and town-groups, is from 71.9% in Madurai and Tiruchirapalli to 80.5% in Salem. Salem and Kurichi town-group have shown very high proportions among married in both the sexes. The proportion of widows is considerable in Vellore town-group, Tiruchirapalli and Thanjavur. It is seen that the proportion of widows is many times the proportion of widowers in all the cities which trend is seen in the State and districts.

When the proportions of the cities are compared to the respective district proportions, it is seen that Salem, Kurichi town-group and Nagercoil show higher married figures and lower never married figures under males. In all other cities and town-groups proportions are higher under never married and lower under married. Compared to the district averages, generally in urban areas, married males are lesser. Among females, in the cities and town-groups of Coimbatore, Kurichi, Tuticorin, Palayamcottai and Nagercoil, more figures under married and lesser figures under never married are to be seen compared to district figures.

For males and females, 35-59 age-group is also predominantly a married age-group. While more than 88% of males are married in all the cities and town-groups, among females the proportion ranges between 60.5% to 69.5%. Never married proportions among males is significant in Kurichi town-group and Thanjavur where nearly 5% are so. Widowed proportions among males are prominent in Tiruchirapalli, Thanjavur and Kurichi town-group. Coimbatore shows lowest proportion under widowers among the cities. Contrasting to this, Coimbatore has shown the highest proportion under separated or divorced. Vellore town-group and Coimbatore show higher proportion under never married females. Even then the proportion does not exceed 2% in any city. Highest proportion of married females is to be seen in Nagercoil (69.5%). The lowest proportion of widows is seen in Coimbatore (26.0%) and the highest in Tiruchirapalli (36.9%). Thanjavur with 34.5% of widows is also to be noted. As in the case of males the highest proportion under females separated or divorced is seen in Coimbatore.

Compared to the district proportion Kurichi town-group, Thanjavur and Nagercoil show lower

proportions under married males. Except in the case of Coimbatore, Madurai, Thanjavur and Tuticorin town-group in all other cities and town-groups we find higher proportion of widows than the respective district average. This would indicate that widows move from rural and minor urban towns to bigger towns and cities for earning their livelihood or to join their children or relatives on whom they depend.

For males, the age-group 60+ is also a married age-group in as much as more than 70% are married. Vellore town-group (76.4%) and Salem (77.0%) show highest proportions of married males. Kurichi town-group has shown the lowest percentage of 70.3 among the cities. More than one fifth of males are widowed in the cities and town-groups. Kurichi (27.8%) and Tiruchirapalli (25.3%) are prominent in widowed category. Coimbatore has shown 2.3% under divorced or separated males.

As the category married is predominant for males, the category widowed is predominant for females. More than three fourths of females in this age-group are widowed. Tiruchirapalli (86.1%) and Madurai (85.2%) have recorded very high figures. In the cities of Madras, Thanjavur and in the town-groups of Vellore, Tuticorin and Palayamcottai the percentage of widows exceed 80%. Coimbatore's 4.2% under separated or divorced is significant.

When the city figures are compared with their respective district averages among males, we find that in all cities and town-groups except Salem, Coimbatore, Madurai and Palayamcottai town-group, the district averages are higher under married. Among females, in all the cities and town-groups except Thanjavur, the proportion of widows in the cities exceed that of their respective district average.

#### **Ratio of females in each marital status by broad age-groups.**

19. In the children's age-group of 0-14, ratio under never married (979) tends to be in line with the general sex ratio of the State (99.2) and this trend is seen in all the districts. 51,489 in a population involving 12,667,171 are married, 454 are widowed and 492 are separated or divorced and the ratios under these civil conditions are very much higher Madras, North Arcot, South Arcot

and Salem show higher ratios under married in this age-group. The southern districts of Madurai, Tiruchirapalli, Thanjavur, Ramanathapuram, Tirunelveli and Kanyakumari have shown lower ratios indicating the generally improved conditions with lesser number of married females in this age-group.

In the adult age-group of 15-34, the sex ratio will be the lowest in the never married category since most of the women of this age-group would be married and more males than females will remain single. The sex ratio in the married category will be higher than the normal sex ratio and the ratio in the widowed category will show the highest ratio as the males who have lost their spouses can contract a second marriage easily rather than females in view of the social custom of the Hindus who predominate this State. This trend is noticed in the State figure. The trend exhibited in the State figure is also noticed in all

the districts. Kanyakumari's higher ratios under married and widowed are to be noted.

In the middle ages of life (35-59) the ratio among married would show lower figures than the general sex ratio and the widowed would show as definite an increase as the decrease in the married group. This would be in accord with the existing conditions. These trends are noticed in the figures for the State and districts.

At the later ages (60+) the ratio among unmarried might be expected to recover a little as those who are unwed at advanced ages are generally so due to particular individual reasons, not from social custom. Married ratio would show a good decrease. Widows should greatly outnumber widowers, a compensation to the figures appearing under married. These tendencies find illustration in the figures exhibited in the table given below:

TABLE VIII - 19  
*Ratio of Females To 1,000 Males for each Marital Status at broad age-groups*

d -- Ratio of divorced or separated females to 1,000 divorced or separated males.

#### **Ratio of married persons of each sex in each age-group**

20. The graph in the previous page illustrates the trends in the married status in each age-group and sex.

A large proportion of female marriages takes place in the age-periods 15—19 and 20—24. A small increase is also noticed in the age-group 25—29. There is decline in the proportions from the age-group 30—34 onwards which indicates

that the females are deprived of married status more and more. The marital status becomes that of widowed, divorced or separated. The rise in the curve for males in the age-groups 20—24 and 25—29 suggests that larger proportion of marriages among males occurs in these two age-periods. The curve continues to rise in the age-groups 30—34 and 35—39 which are not however steep. The other age-periods exhibit declining trend in the married proportion but

the decline is gradual unlike in the case of females. That the highest proportion of females is in married status in the age-group 25—29 and that the highest proportion of males in married status is in the age-period 35—39 is disclosed by the graph.

The table below gives the ratio of wives to 1,000 husbands at certain specified age-groups in the State, districts and cities and town-groups with a population of one lakh and over.

TABLE VIII — 20  
*Ratio of wives to 1,000 husbands at each age-group*

State, District City	Age group								
	0-9	10-14	15-19	20-24	25-29	30-39	40-49	50-59	60+

Ratio of wives to 1000 Husbands at each Age-Group in Madras State

TABLE VIII - 20 (Contd.)  
*Ratio of wives to 1,000 husbands at each age-group*

State District City	Age-group									
	0-9	10-14	15-19	20-24	25-29	30-39	40-49	50-59	60+	
1	2	3	4	5	6	7	8	9	10	
Kurichi (T.G)	.	12,167	19,453	4,060	1,439	864	551	453	274	
Madurai (M)		18,667	22,283	2,295	1,650	838	563	400	199	
Tiruchirapalli (M)		4,792	27,792	4,456	1,552	834	550	364	179	
Thanjavur (M)		3,923	26,033	1,484	1,938	945	618	422	211	
Tuticorin (T.G)		904	20,364	5,222	1,561	900	591	416	228	
Palayamecottai (T.G)		1,613	21,241	1,430	1,552	1,027	672	483	245	
Nagercoil (M)		2,700	40,696	7,990	17,848	913	716	593	270	

This table is intended to indicate age-groups where the proportions of married men and proportion of married women tend to fall.

At the State level the ratio increases steeply in the age-group 15-19 from that of 10-14. When we come to the age-group 20-24 there is a considerable decrease in the ratio. In the age-group 25-29 there is further decrease in the proportions. The age-period 30-39 shows a further reduction in the ratio and is marked out by the fact that the ratio becomes comparable with the general sex ratio. In the latter age-periods the ratio decreases from one period to another.

These trends are noticed in the figures of the districts. In the southern districts of the State ratio under 10-14 is much less than in the other districts. This may probably be due to the higher age of marriage.

This table also reflects the difference between the ages of husband and wife as it is likely that many of the husbands of wives of a particular age-group will be reckoned in the higher age-group.

#### Age at marriage

21. From the data on Fertility survey of ever married women conducted on a sample basis, it is estimated that in the marriage duration 0-4 years (current level) the average age at marriage is 18.2 in rural areas and 18.3 in urban areas of the State. The median age at marriage for rural and urban areas is 18.1 and 18.2 respectively.

It will be seen from the following table that there has been a gradual increase in the age at marriage of women during the past three decades.

TABLE VIII — 21

*Percentage distribution of women by age at marriage in different durations of marriage*

Rural Age at marriage			Marriage duration (in years)	Urban Age at marriage		
23+	18-22	-18		-18	18-22	23+
1	2	3	4	5	6	7
4.0	49.2	46.8	0	47.8	47.8	4.4
3.4	49.3	47.3	1-4	46.0	50.2	3.8
2.3	40.3	57.4	5-9	55.8	41.9	2.3
1.8	31.7	66.5	10-14	70.7	27.5	1.8
2.1	32.8	65.1	15-29	69.3	29.1	1.6
1.5	34.3	64.2	30+	72.1	26.5	1.4
2.2	36.9	60.9	All duration	63.4	34.5	2.1

The increase in age at marriage with the efflux of time may be due to increasing literacy, urbanisation, industrialisation, etc.

## CHAPTER IX

### LITERACY AND EDUCATION

#### Definition of literacy

Literacy is defined as the ability to read and write. The test for literacy is satisfied if the person can read and write a simple letter in his mother tongue or in any other language. A person who knows only to read or a person who can write only figures and sign his name was treated as illiterate. In the instructions issued to the enumerators, they were authorised to test a person, if necessary, by asking them to read and write a few lines.

#### Question on literacy and education

2. In the Individual Slip, Question No. 6 related to education and literacy. It consisted of two parts, the second part being filled in only in the case of literates. The first part of the question elicited the fact as to whether a person was literate or illiterate. In the case of literates, the highest educational attainment was ascertained. In the second part, educational attainment meant the highest examination passed by the individual.

The following were the abbreviations used:

‘O’ for illiterates

‘L’ for literates without any specific educational attainment.

In the case of literates who have passed some examination, the highest examination passed was noted including technical Degree and Diploma.

#### Comparison with International definition

3. I will now discuss how these definitions agree with the International definitions recommended in the Handbook of Population Census Methods.

According to them, for Census purposes, literacy is defined as the ability both to read with understanding and to write a short statement in every day life in any language. A person capable of reading only should be considered illiterate. Also a person capable only of reading and writing figures and his own name should be

considered illiterate, since literacy is defined as the ability to both read and write. A single item in the questionnaire on this topic is considered adequate.

Data on literacy should be collected for all persons who are 15 years of age and over. If a lower age limit is used for collection, all tabulations not cross-classified should be sub-divided at this age so as to facilitate international comparison. The international standard is slightly higher than what was applied in India. For international purposes, 4 educational levels were recommended:-

1. Nursery, Infant school or kindergarten;
2. Elementary or Primary;
3. Secondary High School or middle; and
4. University or higher professional.

In the urban areas, the data have been tabulated by more educational levels.

Thus it will be seen that Indian standard of literacy is much lower than the international standard.

#### Uniform test of literacy in all areas not possible

4. It has always been difficult to apply a test of literacy uniformly throughout the country. For one, the enumerators interviewed the heads of households or any one responsible member of the family. It is always difficult to subject the girls and women to any literacy test; neither was the right given to the enumerator to subject any person to a test uniformly used. The rough standard adopted was to associate literacy with some stage of primary education or school attendance with the result that the standard has varied from area to area. It has also happened that students attending second standard in an area have been declared literates while in some other areas, they have been declared as illiterates.

#### Changes in concepts on literacy and education 1871-1961

5. The concept on literacy and education has also

undergone changes in Indian Censuses. In the three Censuses of 1871, 1881, and 1891, the people were classified into 3 categories—literate, illiterate and people under instruction or people attending schools, college or private institutions. The third classification contained two questions, one dealing with the people in institutions of learning and the other, people not in institutions. The latter classes were classified as literates and illiterates and the people in institutions though counted as literates, for the purposes of totalling literacy figures, were shown separately.

In 1891, the enumerators also entered the language best known to the person or the language in which the person was literate. Further, the ability to read and write English in addition to his mother-tongue was also recorded.

In 1901, the present classification of literates and illiterates was introduced deleting the third category 'Under instruction'. The tables prepared also showed the literates in different Indian languages separately. A second question was specifically asked in 1901 to the effect whether a person was literate in English. The other change effected in 1901 was to define literacy in more concrete terms.

Previously literacy was defined as the ability to read and write, but in 1901, literacy was clearly defined as the ability to read and write a letter to a friend. It was further clarified that young children who could read and write a few words with difficulty should be classified as illiterates.

Census questionnaires of 1911, 1921 and 1931 followed the same pattern. The Census of 1941 marked the third stage of evolution of the concept by introducing a question on specific educational attainment or the highest examination passed, besides retaining the two old questions relating to literacy in Indian languages and literacy in English. The 1941 Census questionnaire also included questions on the highest examination passed. The question on literacy was actually sub-divided into three small questions which read as follows.

1. Can you both read and write ?
2. If so, what script do you write ?
3. Can you only read ?

The most useful contribution in 1941 was the question on educational standard which ran as follows

1. How far have you read ?
2. Give any examination passed ?

These particulars were not, however tabulated because of the out-break of World War II.

Further modifications were made in 1951. When the question on literacy and education was put, the enumerator was asked to indicate the highest examination passed in the case of literate persons. The previous question on literacy in Indian languages and English was eliminated. The abbreviations used in the instructions to the enumerators read as follows :

Write 'O' for a person who can neither read nor write.

Write '1' for a person who can read but cannot write in any language

'2' for persons who can read and write

If persons are noted as '2' note also the recent examination passed.

In the concept of literacy, the persons who can read only was given up in the 1961 Census. The people were classified as literates and illiterates. In the case of literates, the highest examination passed was also entered.

#### Tables on literacy and education

6. The tables which deal with information on literacy and non-literacy are the Primary Census Abstracts (Columns 15, 16 and 17), B-III Part A, B-III Part B, B-VI, B-VIII Part A, B-VIII Part B, C-III Part A, C-III Part B, and C-III Part C, C-VIII Parts A and B, D-IV, S. C. I, III Part A, S. C. I, III Part B, and S. C. I.

#### Literacy proportions 1901-61

7. Table IX-1 gives the number of total, male and female literates per ten thousand of population in Madras State for the period 1901 to 1961. It will be seen that literacy has risen from 764 to 3,141 during the period. It means that among males it rose from 1,452 to 4,454 which is very high. The female literacy has risen from 102 to 1,817, a remarkable increase. It shows that the period had witnessed appreciable rise in the female literacy in the State. These figures are exhibited in the form of three graphs. The fact remains that literacy rates have shown a more remarkable increase during the decades 1931 to 1961. Graphs have also been prepared for each district indicating the rise in the level of literacy and the variation from district to district highlighted.

**Number of Total Male and Female Literates per 10,000 of Total Male and Female Population including Population aged 0 - 4 Respectively in the State, 1901 - 61**

Number of Total Male and Female Literates per 10,000 of Total Male and Female Populations  
(including Population aged 0-4) Respectively in the State, 1901-61

Kanyakumari	1,548	2,513	776	1,815	2,465	1,153	1,400	2,288	503	*	...	...

\* For 1901, figures for Ramanathapuram and Kanyakumari are not taken into account due to non-availability of data and the State proportions for these areas are exclusive of the figures for the two districts.

Proportions for the State and districts have been worked out by adjusting the literates for the earlier years to the present indication.

**Distribution of literates among the districts by sex**

8. Table IX-2 gives the distribution of ten thousand of total, male and female literates among the districts of the State for the same period. A remarkable achievement is noticed during the period 1951 to 1961, when literacy rose from 2,086 to 3,141 in the entire State. Appreciable progress has been recorded in the districts of Chingleput, South Arcot, Salem, Coimbatore, Nilgiri, Madurai, Tiruchirapalli, Thanjavur, Ramanathapuram, Tirunelveli and Kanyakumari. This result has to some extent been

achieved by the rise in the literacy level of females during the period. This spread of literacy is to a large extent due to the determined efforts of the State Government to impart primary and secondary education to all and to the enterprise of the public in opening as many schools as possible. The achievement in education has been discussed separately in our evaluation of the first two plans of Madras State. It will, however, be of interest to find out to what extent the problem of literacy has been tackled in the past in this State

TABLE IX — 2  
Distribution of 10,000 total, male and female literates among the districts of the State, 1901 to 1961

State, District	1961			1951			1941

(Please see notes under Table IX-1)

### **Notes from earlier Census reports on the literacy figures**

9. In 1871 wide difference was noticed in the conditions of several districts in education. The town district of Madras stood highest with 18.3%, the district of Thanjavur 8.8%, Tirunelveli ranked third in order with 8.2%, Nilgiri had 8.1% Chingleput district 7.9% and Salem district 2.8%. The proportion struck one as being unusually small, but it was accounted for by almost the total absence of education among female sex. If we took the male population alone, exclusive of Madras town, we find that 9.30 out of ten thousand were able to read and write, while on the other hand only 16 women out of ten thousand were able to read and write. Female education outside the Presidency town had made the greatest stride in Tirunelveli—6 females out of one thousand were educated. While Thanjavur district had high standard in male literacy, among females one in a thousand only was educated. This better literacy of females in Tirunelveli was mainly due to the efforts of the Protestant Missions of this district.

The education of women in India, according to the then Superintendent, was a matter of recent development and due almost entirely to the Christian Missions. The instruction of women was opposed to the tradition of the Hindus. The Hindu law 'Manu' says that day and night women should be held by their protector in a state of dependency. "Their fathers protect them in childhood, their husbands protect them in their youth, their sons protect them in old age and a woman is never fit for independence". It was hardly a wonder that among the Hindu people, the only responsible position of a woman is that of a wife and the only education required by her is the knowledge of the duties of a household.

In 1881, a proportionately high return of education was noted among native Christians in Tirunelveli. 34.09% of the Christian males and 13.36% of the Christian females above 5 years of age were educated. It will be remembered that education was the first weapon of the Missionary. In Tirunelveli, Christians are mostly Protestants. In Madurai we find more Roman Catholics where the percentage of educated among Christians is 21.84% for males and 4.08% for females.

In 1901, persons who could boast of a limited amount of learning number only 63 in every one thousand of population, that is 119 for every one thousand of males and only 9 in every one thousand females. The best educated districts after excluding Madras and Nilgiri are the two rich ones of Thanjavur and Tirunelveli. Chingleput, Madurai and South Arcot stand next. At the other end of the scale is Salem.

A very small number of girls who can read and write affected the percentage considerably in Madras and Nilgiri where female education is more advanced than in Tirunelveli. The attention paid to the instructions of their daughters by parents in Thanjavur, Madurai and South Arcot is disproportionately small in comparison to that given to the education of their sons. The literacy of the native Christian is highly increasing the position which he holds among the people. Next to Christians were the Musalmans, as in 1891, both their men and women were more literate in the Census meaning of the term than those of the Hindus. But there is little to choose between the literacy of the women of both religions and in higher education, the Musalmans were known to rank below the Hindus.

It will, however, be seen that Christians were less literate than Mohammedans in North Arcot and Tiruchirappalli and than Hindus in South Arcot. The Hindus are more literate in Madras. After the Eurasians, Brahmins are the most literate community. Among Brahmins as a body, 308 in every one thousand can read and write. That Brahmins should be more literate than the rest of the community was to be expected. For generations the caste had kept all knowledge as its own. Things have changed. All castes have taken to education and before long the difference between castes in educational attainment will disappear. The policy of the State has been so regulated as to provide more educational opportunities to the weaker sections of the community. One distinguishing feature of the recent decades is the liberation of the Hindu female from orthodoxy and her taking to formal education. The leeway to be made up is still considerable.

### **Distinction between literacy and education**

10. Literacy is an important acquirement in the lives of the people, though that importance

has been magnified. Literacy has also to be distinguished from education. It is not equivalent to education, but only a means to that end. A man who is illiterate can be quite a useful and effective citizen of society. With our tradition of imparting education orally, including religious text books, the fact that a person is illiterate, that is, he cannot read and write does not show that he is not educated. However, a study of literacy figures will help us to assess the progress of education in the State, though an estimate of the progress of the enrichment of mind which consists of true education has to be sought elsewhere. Again, literacy is associated in the lay mind with the capacity to do useful work and earn. As

such, to what extent literacy has influenced the pattern of the working force is of great interest.

The average worker in India need not be a literate. A skilled worker often is not. Our education in British days has been intended to produce clerical staff and petty officials to run the machinery of the Government. In spite of the attempt made to preach the gospel of basic education, the fact remains that employment in some form or another is the ultimate object of any person entering our schools and colleges

#### Literacy proportion in India and States, 1951-1961

11. The literacy rate of India and other States is reproduced in the following statement:

TABLE IX — 3  
*Proportion of literates to total population (including population aged 0-4 in India and major States, 1951-61*

State	1961 Literacy rate			1951 Literacy rate		
	No. of persons to 1,000 persons	No. of males to 1,000 males	No. of females to 1,000 females	No. of persons to 1,000 persons	No. of males to 1,000 males	No. of females to 1,000 females
1	2	3	4	5	6	7
India	240	345	130	166 †	249 †	79 †
Andhra Pradesh	212	302	120	132	197	65
Assam	274	373	160	183	274	79
Bihar	184	298	69	122	205	38
Gujarat	305	411	191	230	323	133

Rajasthan	152	237	58	89	144	30
Uttar Pradesh	176	273	70	108	174	36
West Bengal	293	401	170	240	342	122

† Excludes the population of Jammu and Kashmir, Pondicherry and North East Frontier Agency.

N.A. denotes not available.

(Source—Statement I of Fly Leaf to C III Age, Sex and Education Vol. I Part II C-1, Social and Cultural tables, India).

Madras has a literacy rate of 314 as against 240 of India. The only State which is ahead of Madras in literacy is Kerala with 468. In 1951, Kerala was ahead of Madras with 407 but Madras had only the fifth place, Gujarat, West Bengal and Maharashtra being ahead of Madras. During the decade 1951-61, Madras has recorded a remarkable increase in the rate, from 208 to 314 which is much more than the increase in the rate in Kerala, Maharashtra, West Bengal and Gujarat. In male literacy, Madras has the second rank in India. But in female literacy, it has only the third rank with 182, Gujarat having 191 for the second rank. But the increase in female literacy rate from 100 in 1951 to 182 is perhaps much more marked than the increase in the female literacy rates of the States like Kerala, Gujarat and Maharashtra. It is, therefore, likely that with rapid increase in female literacy, Madras will forge ahead further in the next decade. It may, however, be pointed out that Delhi Union territory has a high literacy rate of 527, 608 for males and 425 for females, far ahead of Kerala and Madras. But Delhi is a cosmopolitan city. Actually, Delhi should be compared with the cities of Madras, Bombay and Calcutta, whose figures are reproduced below.

City	Total	Males	Females
Madras	595	696	482
Bombay	586	651	488
Calcutta	593	636	523
New Delhi and Delhi M. Corporation and Delhi Cantonment	Delhi T.G. 554	628	460

Actually, all the three cosmopolitan cities in India are ahead of Delhi with Madras leading. Perhaps Madras city is the best educated city in the whole of India.

#### Literacy proportions in the State and districts

12. The proportion of literates in the rural and urban areas of the State and in the districts are given below.

TABLE IX — 4

*Proportion of literates per 1,000 of population in the rural and urban areas of the State and districts*

State District	Rural			Urban		
	Total	Males	Females	Total	Males	Females
1	2	3	4	5	6	7
Madras State	247	378	116	499	627	367
Madras			...	595	696	482
Chingleput	230	350	105	466	597	326
North Arcot	202	325	78	426	554	295
South Arcot	239	377	98	479	597	318
Salem	157	248	65	413	538	282

1	2	3	4
Thanjavur	336	487	187
Ramanathapuram	321	483	168
Tirunelveli	364	500	235
Kanyakumari	486	562	407

(See note under Table IX-4)

### Effective literacy rates

13. The more correct index of literacy is the effective literacy which means that in calculating the literacy percentage those in the age-group 0-4 are excluded. The figures are given below:

TABLE IX — 6

*Effective literacy proportions in the State and Districts (per 1,000 of population)*

State/District	Rural	Urban
1	3	4
Madras State	364	577
Madras	685	685
Chingleput	325	539
North Arcot	290	493
South Arcot	312	534
Salem	231	481
Coimbatore	346	543
Nilgiri	421	522
Madurai	388	574
Tiruchirappalli	344	595
Thanjavur	386	596
Ramanathapuram	373	556
Tirunelveli	418	550
Kanyakumari	565	666

The literacy proportion is considerably high in the urban areas for the State as a whole and for each district. This is because more educational institutions are found in urban areas. Children are not deprived of the opportunity to study because of their diversion to work in agricultural activities. Elementary Education Act has made it obligatory on parents to ensure that their

children aged five years and above are put to school, non-compliance entailing prosecution. This Act is rigorously enforced in the urban areas than in the rural.

In the urban sector literacy level is the highest in Madras district with Kanyakumari following close. Salem has the lowest percentage of literacy when compared with other districts. In the rural sector, highest percentage of literacy has been recorded in Kanyakumari followed by Tirunelveli. Salem has the lowest percentage.

### Literates by educational levels

14. The statement given below shows the distribution of literates by educational levels in the rural and urban areas:

TABLE IX — 7

*Distribution of one thousand literates in the State by educational levels*

Educational Levels	Rural	Urban	Total
1	2	3	4
Literate without educational level	789	540	683
Primary or Junior Basic	178	331	243
Matriculation	33†	109	74
Technical Diploma	.	2	..
Non-Technical Diploma	.	N	.
University Degree	.	14	..
Engineering	.	1	..
Medicine	...	N	...
Agriculture	...	N	...
Veterinary	...	N	...
Technology	...	N	...
Teaching	...	2	...
Others	...	N	...

† Includes persons with educational levels above matriculation

N denotes negligible proportions

In rural areas, 17.8% of literates have attained primary level and 3.3% matriculation and above. While in the urban areas, 33.1% literates have attained primary level and 10.9% have attained matriculation standard and only 1.4% are degree holders. Actually, technically qualified persons formed a very small percentage of educated

personnel. This is perhaps due to the fact that technical education is expensive and the number of institutions is limited.

### Male literates

15. 44.54% of the males are literates as against 31.64% in 1951. The statement below shows the percentage of literacy among males in the rural and urban areas of the districts in the State.

TABLE IX — 8

*Proportion of male literates per 1,000 of male population in the rural and urban areas of the State and districts*

State/District	Total	Urban	Rural
1	2	3	4
<b>State</b>	<b>445</b>	<b>627</b>	<b>378</b>
Madras	696	69	
Chingleput	402	597	350
North Arcot	371	554	325
South Arcot	406	597	377
Salem	296	538	248
Coimbatore	433	599	363
Nilgiri	483	556	424
Madurai	481	633	410
Tiruchirapalli	447	651	390
Thanjavur	487	659	442
Ramanathapuram	483	633	133
Tirunelveli	500	616	447
Kanyakumari	562	655	546

(See note under Table IX-4)

Madras city leads with 69.6% and the districts of Kanyakumari and Tirunelveli come next with 56.2% and 50.0%.

The statement below shows the progress of literacy from 1921 onwards among males:

		Madras State (Per thousand)
1921	...	185
1931	...	199
1941	...	256
1951	...	317
1961	...	445

### Female Literacy

16. About 18% of females in the State are literates. The progress of literacy among females is shown below.

		Madras State (Per thousand)
1921	...	25
1931	...	30
1941	...	69
1951	...	101
1961	...	182

The progress of literacy among females is not impressive in the earlier decades. It has, however, showed a marked increase from 1951 to 1961. It stood at 3.0% in 1931 and has risen to about 18% in 1961. Female literacy is lowest in Salem and highest in Madras City. Next to it comes Kanyakumari with 40.7%.

The proportion of literates is given below.

TABLE IX — 9

*Proportion of literates per 1,000 females in the State and districts*

State/District	Total	Urban	Rural
1	2	3	4
<b>State</b>	<b>182</b>	<b>367</b>	<b>116</b>
Madras	482	482	...
Chingleput	151	326	105
North Arcot	122	295	78
South Arcot	127	318	98
Salem	100	282	65
Coimbatore	167	331	101
Nilgiri	219	323	139
Madurai	186	352	111
Tiruchirapalli	153	378	94
Thanjavur	187	380	137
Ramanathapuram	168	334	114
Tirunelveli	235	350	183
Kanyakumari	407	495	392

**Literacy by sex in rural and urban areas**

17. Table IX-10 gives an analysis of effective literacy by total, rural and urban and by males and females for 1961. Table IX-11 gives the distribution of 10,000 literates of each sex in the rural and urban areas of districts. In Table IX-12 total, rural & urban literacy proportions are arranged in the decreasing order in order to facilitate a detailed analysis. Salem has the lowest place in total literacy. In the rural sector, Kanyakumari heads the list and in the urban sector, Madras, Tirunelveli and Nilgiri also lead in rural literacy. In urban literacy, Kanyakumari and Thanjavur are also ahead. The urban sector of Kanyakumari district has the second place as against the first place in the rural sector. Salem has the last place in the matter of literacy in all the three sectors. Table IX-13 presents the districts in a re-arranged form on account of the order of literate population as compared with the total State. The first three places are taken by Thanjavur, Coimbatore and Madurai. Tiruchirapalli retains the first place in the rural sector. Tiruchirapalli occupy the second and third places respectively. In urban literacy, Madurai is contributing more than 22.92% of the total literates. The next two

places are taken by Madurai and Coimbatore. In rural literacy, Thanjavur, South Arcot and Tiruchirapalli form a continuous belt. In these districts from the closing years of the 19th century spread of education has gained momentum. One factor is the prevalence of the larger number of Brahmins in these districts who have shown a desire for western education earlier than anyone else did. Their entry in the Government services earlier than the other communities has led them to think of education as beneficial for their community. In Table IX-14, the districts are grouped in relation to the average rate of literacy in urban and rural areas of the State as a whole. Two maps of the State showing the rural and urban areas of the districts in relation to State average for literacy are presented separately. It will be seen that in the rural sector, Chingleput, North Arcot, South Arcot, Coimbatore and Tiruchirapalli fall below the State average and Salem much below. In the urban sector only the districts of Madras, Tiruchirapalli, Thanjavur and Kanyakumari are ahead of the State average, but the disparity between the districts is not as marked as in the rural sector. Kanyakumari and Thanjavur are ahead of other districts both in urban and rural literacy.

TABLE IX - 10  
*Proportion of total, male and female literates in rural and urban areas of the State, 1961*

#### Rural literacy by taluks

18. The rural literacy rate for the State works out to 2,467 per 10,000. The rate has been calculated taking in to account the population in the age-group 0-4 also.

#### Chingleput District

One taluk, Ponneri, has shown literacy rate below the State average by more than 25% but less than 50%. Five taluks show rates below the State average upto 25%. Saidapet taluk has

shown a rate higher by more than 25% but less than 50% and Sriperumbudur higher upto 25% of the State average. Out of 8 taluks, 6 taluks have shown rates below the State average and the district has to be considered not above average.

#### **North Arcot District**

All the taluks show rates lower than the State average. Two taluks — Tiruppattur and Chengam have rates lower by more than 25% but less than 50% of the State rural average. The district has to be considered very backward in literacy and education in as much as all taluks show lower literacy rates.

#### **South Arcot District**

Out of 8 taluks, only three taluks — Cuddalore, Chidambaram and Vriddhachalam have shown rates higher upto 25% of the State average. The remaining five taluks are having rates lower than the State average upto 25%.

#### **Salem District**

All the taluks show rates below the rural average for the State. Seven taluks are heavily concentrated in the range of 25 to 50% below the State rural average. One taluk - Hosur has literacy rate lower by more than 50% of the State rural average. The district has to be considered most backward in education.

#### **Coimbatore District**

Majority of the taluks (6 out of 9) are having rates below the State average. Two taluks Gopichettipalayam and Bhavani show lower rates in the range of 25-50% below the State rural average. Three taluks — Coimbatore, Pollachi and Udumalpet have rates above the State average upto 25%.

#### **Nilgiri District**

The entire district has to be considered above average in as much as all the three taluks are having rates higher than the rural average for the State (i.e.) upto 25% above.

#### **Madurai District**

5 taluks out of 8 have rates higher upto 25% of the State rural average. Three taluks — Dindigul,

Palni and Melur are having rates which are lower upto 25% of the rural average for the State.

#### **Tiruchirapalli District**

Majority of the taluks, 7 out of 10 have rates lower upto 25% of the State average. Only three taluks have rates higher than the State average upto 25%. The taluks are Lalgudi, Musiri and Tiruchirapalli. The district has to be considered below average in rural literacy.

#### **Thanjavur District**

Eleven out of twelve taluks show rates higher than the State general average. Out of the eleven taluks, four—Mayuram, Nannilam, Nagapattinam and Tiruthuraipundi — are having rates higher by more than 25% but not more than 50%. The district can be considered forward in literacy and education. Only Orathanad taluk has a rate lower upto 25% of the State rural average.

#### **Ramanathapuram District**

Only three taluks show rates lower than the rural average for the State. One taluk — Sattur has shown a rate higher by more than 25% but not more than 50%. Five have rates higher within 25% of the State figure. This district can also be considered better placed in the matter of literacy.

#### **Tirunelveli District**

One taluk out of nine—Sankaranayinarkoil has a literacy rate lower than the State rural average. Three taluks — Srivaikuntam, Ambasamudram and Nanguneri have shown rates higher than the State average in the range of 25 to 50% while one taluk (Tiruchendur) is having a rate higher by more than 50% of the State average. Tirunelveli has to be considered well up in the rural literacy picture of the State.

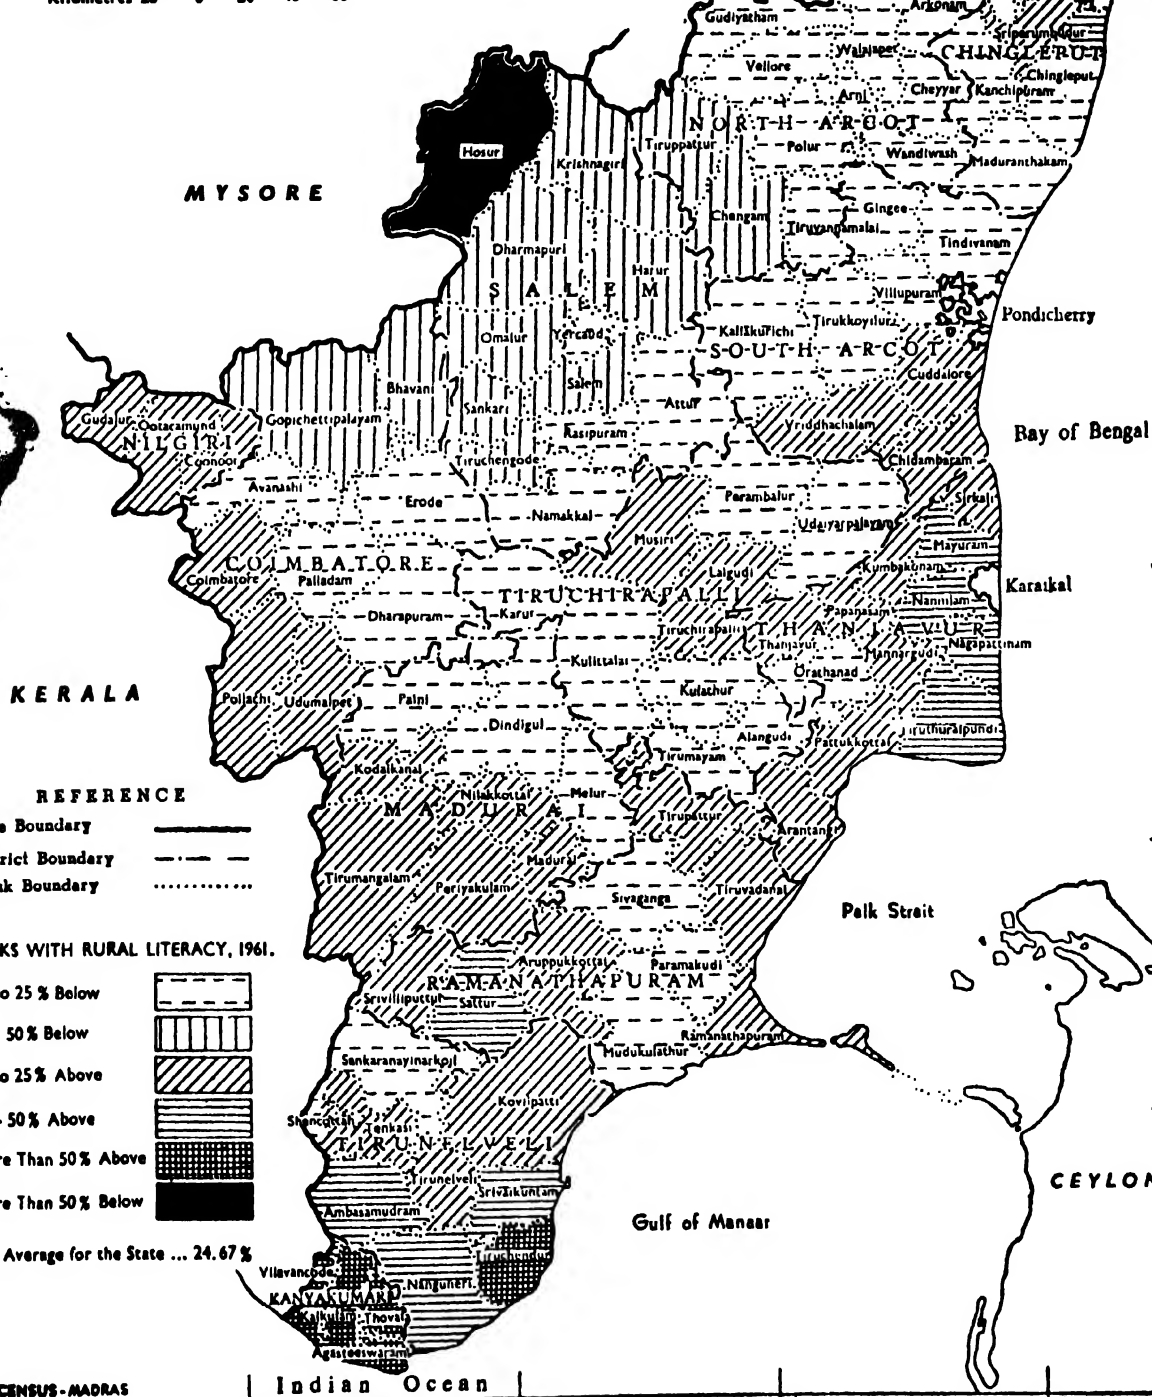

#### **Kanyakumari District**

The most educationally forward district in the State is Kanyakumari. All the taluks have a literacy rate higher by more than 50% of the State rural average.

#### **Urban literacy by taluks**

As classified above, taluks have also been classified with reference to their urban

**TALUKS HAVING RURAL LITERACY ABOVE  
OR BELOW THE RURAL AVERAGE  
FOR THE STATE, 1961.**

literacy rates. The urban literacy rate for the State works out to 4,991 per 10,000 taking into consideration the population in the age 0-4.

### **Madras**

The district is having a higher rate which is upto 25% of the State urban average.

### **Chingleput District**

Seven out of nine taluks show lower literacy rates. Six out of these seven are having lower rates which are within 25% of the State urban average. One taluk (Maduranthakam) has shown rate lower by 25-50% of the State average. Two taluks are having rates higher within 25% of the State average and they are Saidapet and Chingleput. This district is to be considered backward in urban literacy also.

### **North Arcot District**

Three taluks show lower proportions than the State urban average. Two taluks - Gudiyatham and Chengam show definitely lower rates (i. e.) 25-50% below the State average. There is no urban area in Chengam taluk. The district has to be considered very backward in urban literacy also.

### **South Arcot District**

All the seven taluks show rates lower upto 25% of the State average. Gingee taluk does not have even a single town. Urban literacy has to improve much in this district.

### **Salem District**

All the eleven taluks are having lower rates than the State average. Two taluks-Sankari and Tiruchengode show rates lower by 25-50% of the State urban average. There is no urban area in Mercaraud taluk. The district is very backward in urban literacy also.

### **Coimbatore District**

Majority of the taluks show rates lower than the State average. Seven out of nine taluks come up as having lower rates. One taluk-Pollachi is definitely far below having literacy rate lower by 25-50% of the State urban average. Only two taluks-Coimbatore and Udumalpet—are having a higher rate upto 25% of the State average. Lower urban literacy is seen in this district.

### **Nilgiri District**

All the three taluks are having rates below the State average. Out of the three taluks, the rate is lower by more than 25% but not more than 50% in Gudalur taluk. Urban literacy is not better compared to rural literacy.

### **Madurai District**

Six out of eight taluks show rates lower upto 25% of the State urban average. Two taluks show higher rates in the range of upto 25% and they are Kodaikanal and Madurai.

### **Tiruchirapalli District**

There is no town in Kulathur taluk. Out of the other nine taluks, five taluks are having rates lower upto 25% of the State average and the other four-Karur, Kulittalai, Tiruchirapalli and Alangudi are having rates upto 25% above the State average. Urban literacy is better than rural literacy.

### **Thanjavur District**

Seven out of twelve taluks have rates higher upto 25% and five are showing lower rates which are within 25% of the State average. Thanjavur district is better compared to the districts discussed above in the matter of urban literacy.

### **Ramanathapuram District**

Only three taluks out of nine, Paramakudi, Aruppukkottai and Srivilliputtur have shown rates lower upto 25% of the State urban average. The other six taluks are having rates higher upto 25% of the State average. Like Thanjavur, Ramanathapuram district has to be considered forward in urban literacy.

### **Tirunelveli District**

Contrary to rural literacy rates, six out of nine taluks are having literacy rates lower than the State urban average. Out of these six taluks, Sankaranayinarkoil and Tenkasi are having rates lower by 25-50% of the urban average for the State. Only three taluks-Srivaikuntam, Tirunelveli and Tiruchendur—are having rates higher upto 25% of the State urban average.

### **Kanyakumari District**

There is no urban area in Thovala Taluk. Two

taluks show rates higher than the State average upto 25%. One taluk-Kalkulam-is having literacy rate upto 25% below the State average. In urban literacy also this district is better.

The areas of different literacy ranges can be seen distinctly by geographical contiguity. There appears to be a tendency of each lower range to merge with the area of next higher and contiguous literacy range.

In the case of rural areas, the higher level of literacy is due to agricultural prosperity, initial advantage in the setting up of educational institutions and social composition of the inhabitants. This can be clearly seen in the case of the deltaic taluks of South Arcot, Tiruchirapalli, Thanjavur and Tirunelveli. The coastal taluks of Ramanathapuram can also be included in this group. The taluks of Kanyakumari had the initial advantage of primary education being made free when the area was under the control of the Travancore State. In addition, in the districts of Ramanathapuram, Tirunelveli and Kanyakumari, the presence of a large number of Christian population which has from decades past reached a higher level of education through missionary efforts has been an important factor.

Another zone of higher literacy rate can be seen in the western portions of the State (i.e) in Niligiri, Coimbatore and Madurai.

The continuous belt of low literacy will be seen in the taluks of North Arcot and Salem districts. Some of the taluks of Chingleput, South Arcot, Tiruchirapalli and Coimbatore districts also come under zones of low literacy which are neither agriculturally prosperous nor industrially well placed.

The factors influencing urban literacy are different, though some of the factors affecting the rural literacy will also be operative in the case of urban areas. Taluks with large towns and cities, towns with a number of industrial establishments favour the emergence of high literacy zones. This will be seen in the taluks having cities of population one lakh and over except Vellore and Salem. This is because of greater avenues of employment and facilities available for higher education in both Arts and Sciences. In other areas, the rate of urban literacy is influenced to a certain extent by the degree of urbanisation and by the extent of migration. Major parts of North Arcot, Salem and South Arcot constitute low literacy zone which have least quantum of urban influence.

TABLE — IX - 15

Kanyakumari	490	594	452	501	510	406	558	499

At the State level, illiterate males are more among non-workers than among workers in the rural areas. Among females, lesser proportion of illiterates is to be found among non-workers than among workers. In the urban sector also, we find more illiterate males among non-workers than among workers and more literate and educated persons among non-workers than among workers under females. These trends are noticed

in all the districts except Salem. In Salem the State trend is noticed among females and among urban males. In the case of rural males, proportion of illiterate workers is slightly more than that of illiterate non-workers.

The statement below shows the districts arranged in the rank of the proportions of literate and educated persons for workers and non-workers in rural and urban areas by sex.

TABLE IX — 19  
Ranking of districts by literacy proportions by sex and workers and non-workers in rural and urban areas

Rank	Workers						Non-workers

7	Tiruchirapalli (413)	Thanjavur (41)		Tirunelveli (708)	Tiruchirapalli (172)		South Arcot (340)	Tiruchirapalli (138)		Tirunelveli (507)	Nilgiri (380)	
8	South Arcot (399)	Chingleput (37)		Chingleput (686)	Chingleput (163)		Madurai (338)	Chingleput (133)		South Arcot (499)	Coimbatore (373)	
9	Coimbatore (389)	Tiruchirapalli (35)		South Arcot (685)	Nilgiri (156)		Coimbatore (316)	South Arcot (132)		Coimbatore (498)	Ramanathapuram (372)	
10	Chingleput (383)	North Arcot (32)		Coimbatore (679)	Coimbatore (149)		Chingleput (296)	Coimbatore (132)		Chingleput (494)	Chingleput (353)	
11	North Arcot (371)	South Arcot (31)		North Arcot (656)	North Arcot (149)		North Arcot (252)	North Arcot (107)		Nilgiri (445)	South Arcot (340)	
12	Salem (247)	Salem (25)		Nilgiri (650)	South Arcot (139)		Salem (249)	Salem (95)		North Arcot (443)	Salem (323)	
13				Salem (616)	Salem (138)		...			Salem (443)	North Arcot (319)	

From the above statement it may be seen that in the number of literate and educated persons, the districts of Madras, Kanyakumari, Tirunelveli, Thanjavur and Ramanathapuram are well placed than other districts. It may also be seen that the southern districts of the State are having a sizable proportion of their population as literate and educated. The districts of Salem and North Arcot have to be considered as the most backward in the matter of literacy and education. Even the industrially advanced district of Coimbatore has a low position.

#### Educational levels of the population by age-groups

20. The discussions that follow are based on the figures presented in Union Table C III

and its subsidiary tables. Union Table C III gives the educational levels of the population by sex and certain age-groups for total, urban and rural areas separately (Parts A, B and C respectively). Subsidiary tables (C III Part B-1 and C III Part C-1) giving the distribution of 1,000 persons in each broad age-group and sex by educational levels have been prepared for urban and rural areas separately.

The statement below extracted from Subsidiary tables C III Part B-1 and C III Part C-1 gives the proportion of illiterates and literates of all levels per 1,000 persons of each sex and broad age-groups for rural and urban sectors of the State as a whole.

TABLE IX — 20

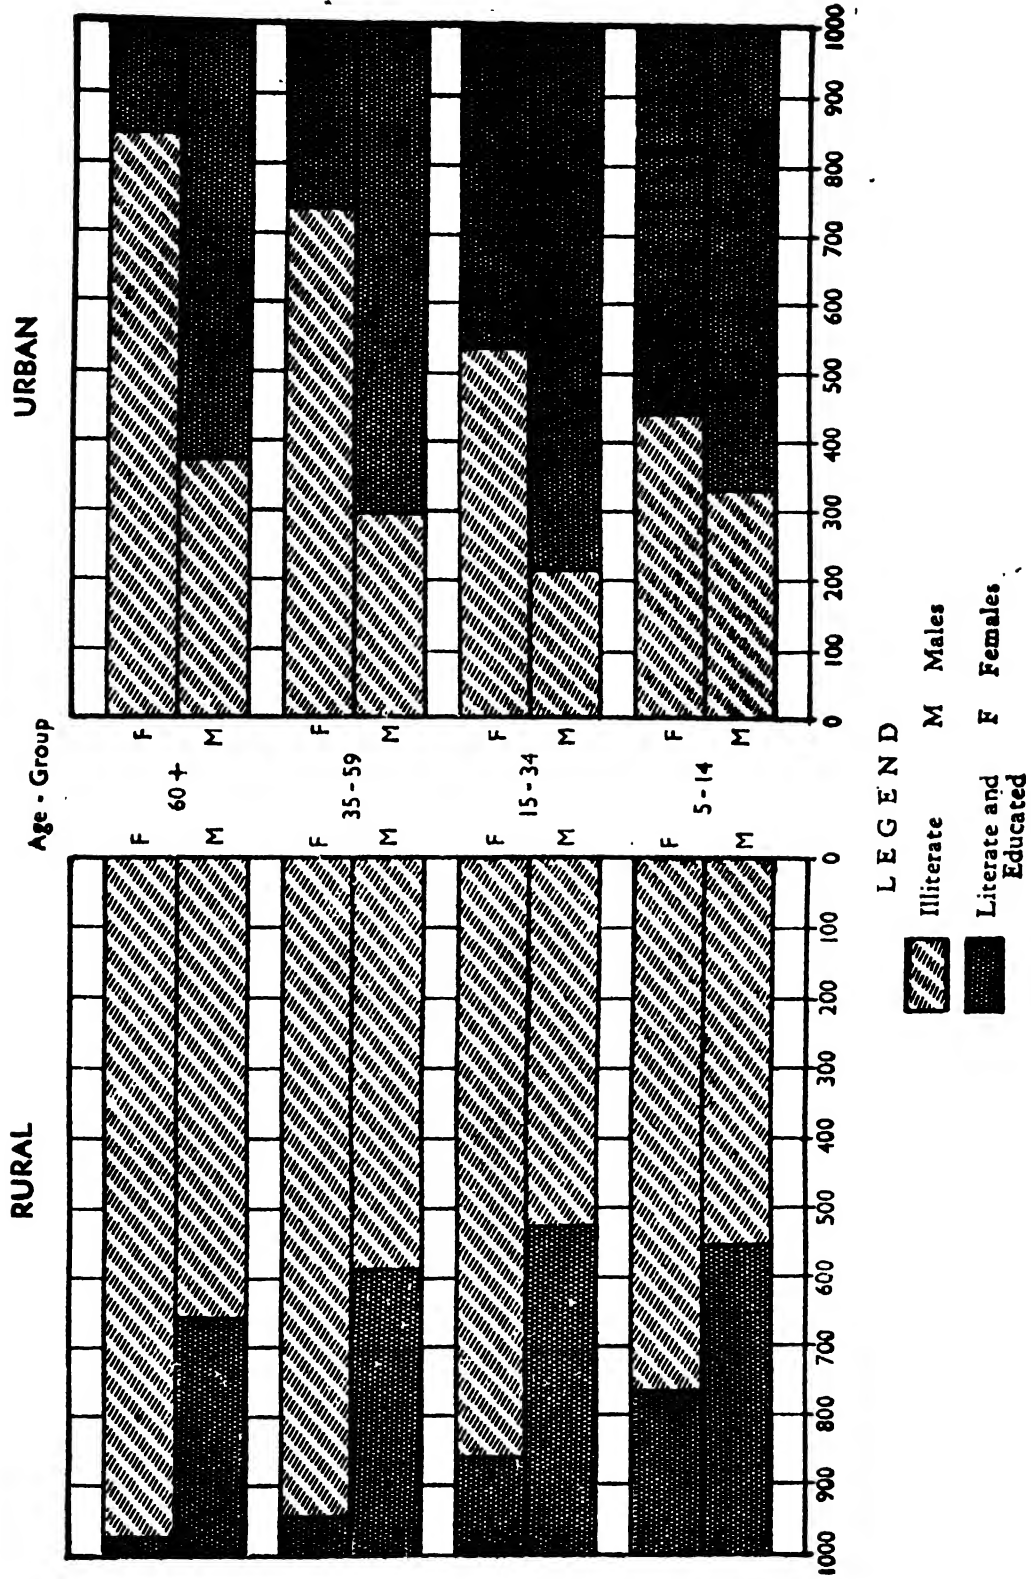

*Distribution of illiterates and literate and educated persons in certain broad age-groups*

Age-group	Rural				Urban			
	Illiterate Males	Females	Literate and educated Males	Females	Illiterate Males	Females	Literate and educated Males	Females
1	2	3	4	5	6	7	8	9
Total population (5 + )	561	866	439	134	277	575	723	425
5 - 14	554	765	456	235	329	444	671	556
15 - 34	527	862	473	138	214	534	786	466
35 - 59	589	945	411	55	295	735	705	265
60 -	660	974	340	26	370	843	630	157

Highest proportions of illiterates in both the sexes and in both the rural and urban sectors are to be seen in the age-group 60+. The proportion of literate and educated persons among males is highest in the two sectors in the age-group 15—34. Among females the proportion in the rural and urban sector is the highest in the age-group 5—14. The lesser proportion of illiterates shown by both the sexes in both the sectors in the younger age-groups of 5—14 and 15—34 indicates the rapid improvement that had taken place

in education during the last few decades and especially during the last decade during which two Five Year Plans were implemented. The rapid progress made in female education is very clearly seen from the above figures. One can also see the supremacy of males even in literacy and education in both the rural and urban sectors. It can be seen that female literacy has to go a long way to attain the level of males. Urban literate proportions are higher in both the sexes than the rural figures indicating

# Distribution of Illiterates and Literate and Educated Persons in Certain Broad Age-Groups

that rural sector has to achieve more in this field.

The table below gives the proportion of illiterates per 1,000 of each sex in the age-

group 5—14 and the proportion of workers in the age-group 0—14 for the State and Districts.

TABLE IX — 21

*Proportion of illiterates in the age-groups 5-14 and proportion of workers in the age-group 0-14*

State/District	Proportion of illiterates in the age-group 5-14				Proportion of workers in the age-group 0-14			
	Rural		Urban		Rural		Urban	
	M	F	M	F	M	F	M	F
1	2	3	4	5	6	7	8	9
<b>Madras State</b>	<b>554</b>	<b>765</b>	<b>329</b>	<b>444</b>	<b>174</b>	<b>130</b>	<b>68</b>	<b>43</b>
<b>Madras</b>	..	..	211	292	..	...	35	9
Chingleput	593	793	400	533	164	87	73	46
North Arcot	651	848	463	574	179	124	84	34
South Arcot	512	755	366	508	161	101	56	21
Salem	672	854	423	560	249	198	119	95
Coimbatore	577	799	341	472	228	180	75	45
Nilgiri	533	733	411	519	89	95	55	37
Madurai	514	748	320	431	185	133	73	39
Tiruchirappalli	514	784	295	425	183	161	63	29
Thanjavur	522	737	302	423	123	64	55	19
Ramanathapuram	501	748	320	453	140	134	78	84
Tirunelveli	526	692	365	478	126	122	79	86
Kanyakumari	305	367	302	340	81	46	54	44

From the above statement it may be seen that in the districts of Salem and North Arcot where the proportion of child workers is high, the proportion of illiterates is also higher and that in the districts of Madras and Kanyakumari where the proportion of workers in the age-group 0-14 is less, the proportion of illiterates is also less.

It can be inferred that child workers (i. e.)

those in the ages 0-14 affect the literacy proportions in as much as those who can be literates by attending schools are deprived of the education so essential to them.

#### Classification of literate and educated persons in Census

21. In the Census Tables dealing with educational levels, distinction has been made

in the classification of population living in the rural and urban sectors. For the rural population, the following educational levels have been adopted.

1. Illiterate
2. Literate (without educational level)
3. Primary or Junior Basic and
4. Matriculation and above.

Since it is felt that the number of persons coming above Matriculation level will not be significant the classification has been restricted as above.

However, for the urban population in addition to the first three categories, the population have been classified under the following levels also:

1. Matriculation or Higher Secondary
2. Technical diploma not equal to degree
3. Non-Technical diploma not equal to degree
4. University degree or post-graduate degree other than Technical degree
5. Technical degree or diploma equal to degree or Post-graduate degree with sub classification for
  - a) Engineering
  - b) Medicine
  - c) Agriculture
  - d) Veterinary & Dairying
  - e) Technology
  - f) Teaching
  - g) Others

Such a detailed classification was considered necessary in view of the higher levels of education prevalent in the urban areas and also to find out the magnitude of educated unemployment.

#### **Educational levels of workers in urban areas**

22. Subsidiary Table B III Part A-1 gives the distribution of 1,000 workers in each sex by educational levels in urban areas. From the subsidiary table it may be seen that at the State level 28.5% of males and 80.3% of females among workers are illiterates. Salem has recorded the highest proportion of illiterates in both the sexes (Males 38.4% ; Females 86.2%). Madras and Kanyakumari have recorded lower proportions of illiterates among workers in both the sexes.

Literate without educational level is the prominent educational level having 38.2% of male workers and 9.9% of female workers in the State. Tirunelveli has recorded the highest proportion for males (48.6%) and Kanyakumari (29.7%) for females. The next important educational level is Primary or Junior Basic which has 20% of male workers and 5.5% of female workers. Madras has the highest proportions in both the sexes (Males 29.1% and Females 13.3%). Matriculation or Higher Secondary is the third prominent group. The State as a whole has recorded a proportion of 10.8% for males and 3.5% for females. Madras with 18.2% for males and 16.5% for females has recorded the highest proportion. Tiruchirapalli, Chingleput and Thanjavur have also recorded higher percentages under males and Kanyakumari under females. University degree holders among workers record a percentage of 1.7 for males and 0.3% for females. Madras and Kanyakumari share the first two places in both the sexes under this group. In the educational level Technical degree or diploma equal to degree or post-graduate degree, males show a percentage of 0.5 and females 0.4 at the State level. The main sub-divisions are Medicine and Teaching Engineering which has a figure of 0.2% for males at the State level, is prominent in Madras (0.4%) and South Arcot (0.4). Higher figures for females under medicine (0.8-)and Teaching (1.3%) are to be seen in Madras. It appears that Madras City affords good opportunities for those technically qualified in view of the large industrial establishments, Government Departments and Hospitals, Colleges and Schools. Kanyakumari's proportions under teaching also deserves mention. South Arcot is prominent under Engineering because of a large number of engineers employed by the Neyveli Lignite Corporation.

#### **Educational levels of urban workers by industrial categories**

23. The table below gives the percentage distribution of workers in urban areas in each industrial category by educational levels separately for each sex.

TABLE IX -- 22  
*Percentage distribution of workers in urban areas by educational levels*

Educational Level	Males								
	Industrial category of worker								
	I	II	III	IV	V	VI	VII	VIII	IX
	2	3	4	5	6	7	8	9	10
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Illiterate	40.7	71.6	54.5	34.7	23.2	35.4	13.1	24.1	29.2
Literate without educational level	43.2	24.1	31.5	51.9	41.9	37.1	44.9	30.8	30.1
Primary or Junior Basic	12.1	4.1	8.1	12.7	25.1	16.7	26.5	22.8	19.2
Matriculation or Higher Secondary	3.7	0.2	4.6	0.7	8.5	8.2	13.5	19.5	15.6
Technical Diploma not equal to Degree	N		0.2	N	0.3	0.8	N	0.3	0.4
Non-technical Diploma not equal to Degree	N		N	N		0.1	N	N	0.2
University Degree	0.3	...	0.6	N	0.9	0.5	1.9	2.3	3.5
Technical Diploma or Degree equal to Degree or post-graduate Degree	N	...	0.4	N	0.1	1.2	0.1	0.2	1.5

Educational Level	Females								
	Industrial category of worker								
	I	II	III	IV	V	VI	VII	VIII	IX
	2	3	4	5	6	7	8	9	10
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Illiterate	89.9	96.5	91.8	77.4	81.3	93.0	86.6	52.9	70.9
Literate without educational level	7.7	2.9	6.9	17.6	12.6	4.6	8.6	8.7	7.2
Primary or Junior Basic	2.2	0.6	1.1	4.9	4.8	1.2	2.8	5.7	10.2
Matric of Higher Secondary	0.2	.	0.2	0.1	1.2	1.1	1.7	28.4	9.5
Technical Diploma not equal to degree	N	.	N	...	N	N	N	N	0.2
Non-technical Diploma	...	...	...	N	N	N	...	0.1	N
University Degree	N	...	N	N	0.1	0.1	0.3	3.5	0.8
Technical Diploma or Degree equal to Degree or post-graduate Degree	N	...	N	N	N	N	N	0.7	1.2

Highest proportion of illiterates among male workers is seen in category II—Agricultural labourer (71.6%). Category III Mining, Quarrying etc. has also more than 50% of the male workers as illiterates. Category VII has the lowest percentage (13.1%). The percentage of illiterates is also lesser in categories V, VIII, IX and VI. Literate without educational level shows a percentage of 24.1 in Category II - Agricultural Labourer and 51.9% in category IV — Household Industry. The percentage for Primary or Junior Basic qualified workers varies from 4.1% in category II — Agricultural labourer to 26.5% in category VII — Trade and Commerce. Workers qualified upto Matriculation or Higher Secondary varies from 0.2% under Category III to 19.5% under Category VIII — Transport, Storage and Communications. University degree holders show a percentage of 3.5 under Category IX - Other Services. Categories VIII and VII have 2.3% and 1.9% under this educational level. Technical degree or diploma equal to degree or post-graduate degree shows a percentage of 1.5 under Category IX - Other Services and 1.2% under VI - Construction.

More than 70% of female workers in categories I to VII and IX are illiterate. In Category VIII 52.9% of workers are illiterates. In categories IV and V more than 12% of workers are simple literates. The percentage is as low as 2.9 in Category II — Agricultural Labourer. Even under categories VII, VIII and IX, the percentage ranges from 6.8 to 8.7 only. Workers qualified in Primary or Junior Basic level show a percentage of 10.2 in Category IX — Other Services and Category II — Agricultural Labourer shows the lowest percentage (0.6). Categories IV, V and VIII show percentages ranging from 4.8 to 5.7. Matric or Higher Secondary qualified workers record the highest percentage of 28.4 under Category VIII — Transport, Storage and Communications. 9.5% are qualified in this level in Category IX — Other Services. Workers with University degrees are prominent in Category VIII — Transport, Storage and Communications. Technical degree or diploma equal to degree or post-graduate degree show a percentage of 1.2 in Category IX — Other Services.

The male superiority in all educational levels and in all industrial categories is to be seen

among urban workers with the exception of female workers of category VIII — Transport and communication in educational levels Matriculation or Higher Secondary and University degree.

The technically qualified persons of urban areas are more found in categories VI — Construction and VIII—Transport, Storage and Communications. The Government and the private sector employ a good number of technically qualified persons. Category VII — Trade and Commerce also has a good proportion of its male workers as literates. Presumably, those engaged in this category have to be literate enough to deal with customers. The lesser proportion of female literate workers in Category VII may be due mainly to the inclusion of hawkers and pedlars of articles of daily use and miscellaneous goods in this category along with those engaged in such institutions as reputed wholesale and retail traders and institutions like Banks, Insurance companies, etc.

Among males, more literates are found in Categories I — Cultivator, IV — Household Industry, V — Manufacturing other than Household Industry, VI — Construction, VII — Trade and Commerce, VIII — Transport and Communications and IX — Other Services. Among females, illiterates predominate in all industrial categories of workers. Among males, those qualified in Matriculation and above form 10 to 23 percent of total workers in each of the categories of V to IX, Category VIII having 22.3% and Category IX having 21.2%. In the case of females, 32.7% of workers in Category VIII — Transport, Storage and Communications and 11.7% of workers in Category IX — Other Services are having educational qualification of Matriculation and above. In the categories of V — Manufacturing, VI — Construction and VII — Trade and Commerce, they form 1 to 2% of workers under each.

It is a natural phenomenon to find persons with educational qualification of Matriculation and above engaged in Categories VIII and IX where workers in Government departments, Railways, Post & Telegraphs etc. are classified, as for entry in clerical or ministerial services the minimum qualification is fixed as Matriculation (S. S. L. C) or Higher Secondary. In the case of Banks, Insurance Companies and Commercial firms, etc., which come under VII — Trade and Commerce

people with a minimum education of Matric or S. S. L. C. are generally taken. Hence this category also shows a good proportion of matrics.

### Educational levels by industrial category of workers in rural sector

24. Corresponding to the tables for urban sector, the tables below present the percentage distribution of workers in each industrial category for the sexes separately for rural areas.

TABLE IX — 23  
*Percentage distribution of workers in rural areas by educational levels*

Educational Level	Males								
	Industrial category of worker								
	I	II	III	IV	V	VI	VII	VIII	IX
	2	3	4	5	6	7	8	9	10
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Illiterate	57.0	77.9	71.9	53.4	38.3	54.8	20.8	27.6	55.9
Literate	37.5	19.9	23.3	40.2	47.8	36.2	62.3	44.9	28.4
Primary or Junior Basic	4.9	2.1	3.7	6.2	11.2	6.5	14.1	16.9	8.9
Matric & above	0.6	0.1	1.1	0.2	2.7	2.5	2.8	10.6	6.8

Educational Level	Females								
	Industrial category of worker								
	I	II	III	IV	V	VI	VII	VIII	IX
	2	3	4	5	6	7	8	9	10
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Illiterate	95.3	97.6	95.3	84.3	87.9	98.0	92.2	77.3	93.3
Literate	4.1	2.1	3.9	12.9	9.9	1.7	6.9	10.3	3.0
Primary or Junior Basic	0.6	0.3	0.8	2.7	2.0	0.3	0.8	3.9	2.6
Matric & above	N	N	N	0.1	0.2	...	0.1	8.5	1.1

Illiterate among male workers records the highest proportion (77.9%) in Category II — Agricultural Labourer. Category VII — Trade and Commerce shows the lowest percentage of illiterates (20.8%). Simple literates have shown the highest percentage of 62.3 under Category VII — Trade and Commerce while the lowest percentage of 19.9 is exhibited by Category II — Agricultural Labourer. Category VIII — Transport, Storage and Communications records the highest percentage of 16.9 for Primary or Junior Basic and 10.6% for Matric and above. While

the category VII — Trade and Commerce has taken the second place under the former level, Category IX — Other Services has taken the second position under the latter educational level.

Category VI — Construction records the highest percentage of illiterates (98.0%) among female workers. It is also to be seen that the percentage of illiterates is much higher in all the categories (i.e.) above 75%. Even Category VIII records such a high proportion as 77.3%. Category IV — Household Industry has the highest percentage of literates without educational level (12.9%) and is followed

by VIII — Transport, storage and Communications (10.3%). Category V — Manufacturing other than Household Industry has shown a percentage of 9.9. Category VIII has also the first place in Primary or Junior Basic. The second place goes to IV — Household Industry. Highest percentage of 8.5 is seen under VIII — Transport, Storage and Communication in the level of Matric and above and the percentage is not significant in any other industrial category.

From the above tables one can see the wide disparity in the proportions exhibited by the sexes in the two sectors. Literacy percentage of females is much lower than males and the literacy percentages of both the sexes are lower in rural sector than in the Urban sector. Percentage of

literate in the Primary sector (Categories I, II III) is much lower than in the other industrial categories of workers. This would indicate that for agricultural pursuits not much of education is necessary. It is the industrial categories in the Secondary and Tertiary sectors that show higher percentage of literate and educated persons. the literate and educated persons find suitable opportunities in these industrial sectors.

#### **Educational levels of non-workers in rural and urban areas**

25. The table below gives the percentage distribution of non-workers of each sex by educational levels in rural and urban areas of the State.

TABLE IX — 24

*Distribution of non-workers by sex and educational levels in rural and urban areas*

Educational Level	Rural		Urban	
	Males	Females	Males	Females
1	2	3	4	5
Total	100.0	100.0	100.0	100.0
Illiterate	67.5	84.7	47.4	60.4
Literate (without educational level)	22.8	12.2	26.2	23.0
Primary or Junior Basic	8.4	2.9	19.7	14.4
Matric & above	1.3	0.2	6.7	2.2
Technical Diploma not equal to Degree			0.1	N
Non-technical Diploma not equal to Degree			N	N
University Degree or post-graduate Degree other than Technical Degree			0.7	0.1
<i>Technical Degree or Diploma equal to Degree or post-graduate Degree</i>			0.1	N
Engineering			N	N
Medicine			N	N
Agriculture			N	N
Veterinary & Dairying			N	N
Technology			N	N
Teaching			N	N
Others			N	N

One can see the difference between the two sectors and between the sexes in the matter of literacy and education. Rural non-workers of both the sexes are less literate and educated than their counterparts in urban areas. More than two thirds of male non-workers and more than four fifth of female non-workers in rural sector are illiterates. About half the males and about three fifths of females among the non-workers in urban areas are illiterates. In both the sectors the highest percentage is to be seen in the category

of literate without educational level. Primary or Junior Basic level is also significant in the urban sector. The difference in the percentage figures exhibited by the sexes is higher in the rural sector than in the urban areas.

#### Educational levels of urban workers

26. The Table below gives the percentage distribution of urban workers in each educational level by Industrial categories separately for each sex.

TABLE IX — 25 (Contd.)  
*Percentage distribution of urban workers in each sex and educational level by industrial categories*

Industrial Category	Educational Level													
	Technical Degree or Diploma equal to Degree or post-graduate Degree													
	Engineering		Medicine		Agriculture		Veterinary and Dairying		Technology		Teaching		Others	
	M	F	M	F	M	F	M	F	M	F	M	F	M	F
I	16	17	18	19	20	21	22	23	24	25	26	27	28	29
I	0.28	.	0.60	0.14	0.58	.	1.19	..	1.32	...	0.49	.	1.61	.
II	.	.	.	.	.	...	...	...	.	...	.	.	.	.
III	7.64	..	0.13	0.27	23.61	.	3.17	...	1.32	...	0.18	.	0.17	.
IV	.	.	0.00	.	.	.	...	...	0.66	...	...	0.05	.	.
V	15.61	.	1.80	0.27	6.91	...	2.35	..	44.74	...	0.88	0.21	1.52	50.00
VI	27.61	9.09	0.04	.	0.38	.	0.40	...	1.97	...	0.04	.	0.93	.
VII	5.45	.	0.95	..	4.61	.	2.39	..	7.89	.	1.18	0.26	3.30	..
VIII	6.16	18.18	3.27	1.23	.	.	...	...	1.31	.	0.94	0.94	1.19	.
IX	37.25	72.73	93.12	98.09	63.91	100.00	90.47	100.00	40.79	..	96.29	98.54	91.28	50.00

Illiterate male workers of the urban areas of Madras State are mainly absorbed in industrial categories IX - Other Services (27.60%) and in Category V - Manufacturing other than Household Industry. Household Industry has also absorbed 10.43% of illiterate male workers. Among female illiterate workers, 28.30% are absorbed in Category IX - Other Services and 25.06% in Category IV - Household Industry. Category II - Agricultural Labourer has absorbed 13.01% of illiterate female workers. Male workers who are simple literates are evenly absorbed in categories V - Manufacturing other than Household Industry (23.37%), IX - Other Services (21.40%) and in VII - Trade and Commerce (21.08%). Simple literate workers among females are mainly engaged in Household Industry (45.91%) and in Category IX - Other Services (23.03%). Male workers qualified in Primary or Junior Basic level are equally absorbed in Category V - Manufacturing other than Household Industry (26.71%), IX - Other Services (25.82%) and VII - Trade and Commerce (23.74%). Female workers of this educational level are concentrated in Category IX - Other Services (59.70%) and in IV - Household Industry (23.08%). The absorption of the workers of this educational level would indicate that some standard of education is required for being employed in these jobs. Male workers qualified in Matriculation or Higher Secondary are mainly engaged in IX - Other Services (38.90%), VII - Trade and Commerce (22.42%), V - Manufacturing Other than Household Industry (16.79%) and VIII - Transport, Storage and Communications (14.70%). For female workers of this educational level, Category IX-Other Services—is the most important in as much as it absorbs 86.30% of such workers. A little more than 5% of female workers of this level are found engaged in VIII - Transport, Storage and Communications. Categories IX - Other Services, V - Manufacturing other than Household Industry and VI - Construction are significant in respect of male workers who are Technical diploma holders. Females of this educational level are mainly concentrated in IX - Other Services (95.40%). In the case of non-technical diploma holders, Category IX - Other Services is the most significant for both the sexes. University degree holders among male workers

are significant in Category IX - which has 54.87% and in Category VII - Trade & Commerce (19.93%). Categories V - Manufacturing and VIII - Transport, Storage and Communications have about 10% each. In the case of females, Category IX has more than 82% and categories VII and VIII have 7% each. Male workers holding Engineering degrees are mostly engaged in IX - Other Services (37.25%), in VI - Construction (27.61%) and in V - Manufacturing (15.61%). 72.73% of female workers of this educational level are engaged in IX - Other Services, 18.18% in VIII-Transport, Storage and Communications and 9.09% in VI - Construction. Workers of both the sexes holding degree in Medicine are mostly engaged in IX - Other Services. Male workers holding degree in Agriculture are to be chiefly found in Category IX - Other Services (63.91%) and in Category III - Mining, Quarrying, etc. (23.61%), while female workers are found only in IX - Other Services. Workers of both the sexes holding Technical degrees in Veterinary and Dairying and Teaching are mainly found in IX - Other Services. Male workers holding technology degree are evenly absorbed in IX - Other Services (40.79%) and 4.7% in V - Manufacturing and about 8% are to be found engaged in Category VII - Trade and Commerce. There are no females with Technology degree.

The distribution of workers of each educational level more or less follows the distribution of population in the industrial categories. Categories IV to IX are significant in the urban areas and they mostly absorb workers in all educational levels.

### Unemployment and Education

27. Table B-VIII Part A gives persons unemployed aged 15 and above by sex, broad age-groups and educational levels in urban areas only. This table has been divided into two sections—those seeking employment for the first time and those employed before but out of employment now and seeking work. The age-groups for the latter division are slightly different from those adopted for the former category.

Out of a total of 64,397 males seeking employment for the first time, 23,862 are in the age-group 15-19 and 26,232 are in the age-group

20-24 and 10,835 are in the age-group 25-34. There are 4,754 females seeking employment for the first time. Out of this 2,169 females are in the age-group 15-19, 1916 in the age-group 20-24 and 595 in the age-group 25-34. Females are considerably less in this category. This will be evident from the fact that whereas 92,958 males are unemployed (never employed and unemployed taken together) only 6,253 females are so. This indicates that in this State men are considered mainly responsible for the maintenance of the family and that women are economically dependent on men and therefore those going in search of job are few among women.

It is to be noted that the bulk (about 70%) of the urban unemployed persons of both the sexes are illiterates and literates below Matriculation or Higher Secondary standard.

#### **Seeking Employment for the first time**

28. From the figures it may be seen that among males, Primary or Junior Basic examination passed persons form the main component of

never employed males with a percentage of 34.60 and closely followed by Matriculation or Higher Secondary examination passed persons with a percentage of 30.98. The third highest percentage is seen under simple literates, the percentage being 21.05.

In the case of never employed females, the main share is accounted for by persons with-Matriculation or Higher Secondary qualification with a percentage of 55.22. They are followed by persons with Primary or Junior Basic qualification recording a percentage of 30.82. The third position goes to simple literates with a percentage of 4.73. It may also be noticed that the number of males and females seeking jobs afresh with higher qualification viz., University degrees or Technical diploma or degrees are considerably lesser and the problem is simpler in their cases.

The table below gives the percentage distribution of persons seeking employment for the first time classified by sex, educational levels and broad age-groups.

TABLE IX — 26

*Persons aged 15 and above seeking employment for the first time classified by sex, educational level and broad age-groups (each age-group being expressed as percentage to all age-groups taken together) in urban areas of the State*

Age-group	Educational level										University Degree or Post-graduate Degree other than technical Degree			
	Illiterate		Literate without educational level		Primary or Junior Basic		Matriculation or Higher Secondary		Technical Diploma not equal to Degree		Non-technical Diploma not equal to Degree

N. denotes negligible figures

The intention behind the above table is to find out at which ages persons of different educational standards begin to seek work for the first time, that is whether the seeking of work is staggered over the ages according to the standard of educational attainment.

About two thirds of males and females who are illiterates fall in the age-group 15-24. Illiterate males begin to seek work even in the first age-period viz., 15-19. As age advances, the percentage also falls. In the case of females, the percentages are similar in the first two age-periods viz. 29.95% each. As in the case of males, the percentage gets reduced in the succeeding age-groups. The higher percentages of females in the age-periods 20-24 onwards over those of males indicate that more illiterate women go in search of jobs in later years which may be due to the loss of the male supporter of the family or the prolonged illness of the head of the household or on account of the economic condition of the family.

Simple literates without any educational standard are also concentrated in the first two age-groups in both the sexes (Males - 70.0%, Females 75.56%) indicating that persons with this educational qualification also start looking for jobs earlier. Female percentages are higher than those of males indicating that females who are simple literates think of securing jobs much earlier than males of this educational level. Primary or Junior Basic educational standard also has concentration in the first two age-periods. This educational level includes all those persons who have qualifications more than Primary level but below Matriculation. The two age-periods are the upper limits for this kind of educational qualification in as much as those going upto S. S. L. C. level but not successful could complete their academic course in these ages.

Coming to the educational level of Matriculation or Higher Secondary, it may be seen that the first two age-periods have the maximum for both the sexes—Males - 84.11%, Females - 90.86%. The figures indicate that members of both the sexes go out in search of jobs soon after they pass the Matriculation or Higher Secondary Examination which will normally coincide in the age-period of 15-19. The much higher percentage of females in the age-group 15-19 over males

would indicate that generally education for urban women stops at this stage and only lesser number of women go in for higher education and that women begin to seek jobs soon after matriculation if they are so interested. The age of matriculation is normally between 15-16. Lesser proportion of males in these two age-groups would indicate that males go for further education and if they do not succeed, they begin to seek jobs by which time they may in all probability come over to the next age-period. The fall in the proportion of females in the age-group 20-24 over that of 15-19 would indicate that either the women get jobs earlier than this age or get married and become housewives. Technical diploma not equal to degree holders among males seeking jobs is chiefly distributed in the age-group 20-24. Normally, Technical diplomas are taken after Matriculation and usually duration of the studies is for a period of three years. They normally are of the age of 20 or 21 when they qualify, and then they begin to look for jobs. Since the implementation of the two Five Year Plans and the expansion of industrial establishments in India and the State, technically qualified persons are in demand and get employed quicker. Most of them would get a job by the time they reach 24 and hence the reduction in the percentage in age-groups of 25-29 onwards. Females are to be found only in the age-group 15-19. Males seeking employment for the first time with non-technical diploma are mainly concentrated in the age-group 20-24 and in the next age-group of 25-29. Females of this educational level are to be seen only in the age-group of 20-24. University degree other than technical degree holders of both the sexes are most prominent in the age-group 20-24. Most of the persons will be completing their degree courses in this age-group and may take some time to get settled in jobs. Age-group 25-29 is also important for this educational level. Those having taken degrees may wait for some time before they get suitable jobs. Males seeking jobs for the first time with Engineering qualification are mostly to be found in the age-group 20-24. By the time they reach the age-group 25-29, they are probably absorbed in jobs. There are no females in this educational level who seek jobs for the first time. Males holding degree in Medicine

are distributed in the age-period 20-24 and 25-29 while for females it is uniformly spread over the period 20-34. Males having degree in Agriculture are found in the age-groups 20-24 and 25-29, while those having degree in Veterinary and Dairying are in age-group 25-29. Males with Technology degrees are concentrated in age groups 20-24 and 25-29 uniformly. There are no females in the above three educational levels seeking jobs for the first time. Males with teaching degrees are prominently seen in the age-periods 20-24 and 25-29. In the case of females, the age-periods are 20-24, 25-29 and 30-34. Probably women seek jobs afresh even after reaching the age 30. From these figures we may reasonably infer that seeking work is more or less

staggered over the ages around which a particular educational qualification may be attained.

**Persons employed before and now out of employment and seeking work**

29. Out of 28,561 males and 1,499 females who seek re-employment in urban areas, 4,571 males and 274 females are illiterates. 9,476 males and 166 females are simple literates and 9,371 males and 425 females are qualified upto Primary or Junior Basic level. 4,603 males and 549 females are having Matriculation standard.

Similar to table IX-27 a table is presented below in respect of persons employed before but now out of employment and seeking work.

Educational Level																
Technical Degree or Diploma equal to Degree or post-graduate Degree																
Age-group	Engineering		Medicine		Agriculture		Veterinary and Dairying				Technology		Teaching		Others	
	M	F	M	F	M	F	M	F	M	F	M	F	M	F	M	F

A.N.S.	...	...	...	...	.	.	.	...	.	...	.	...	...	...		

Highest proportion of illiterate males seeking re-employment is to be seen in age-group 25-34 and it is closely followed by 35-44 and 45-59. In the earlier age-periods the proportions are lesser. Higher proportion is seen under 60+ closely followed by 45-59 and 35-44 and 25-34 for females. In the case of literate males, age-groups 25-34, 35-44 and 45-59 are prominent. In the case of females, age-groups 15-19 and 20-24 are prominent. As age advances, in the case of females, lesser proportion seek re-employment presumably because they stick to their jobs whatever may be the conditions of service or they leave the field after marriage. The higher figures for males in these age-groups would mean that after some time they are thrown out and had to seek jobs again. There may also be cases of males trying to change jobs after gaining some experience. For Primary level, in the case of males, the age-groups 20-24 and 25-34 are significant and in the case of females, the age-periods 15-19, 20-24 and 25-34 are significant. In the case of Matriculates, among males the age-periods 20-24 and 25-34 are prominent and in respect of females, 20-24 and 15-19 are the significant ones. Technical diploma holders are significant in 20-24 and 25-34 for males and for females age-period 20-24 has 60%. For University degree holders age-groups 20-24 and 25-34 are important for both the sexes. In addition males have a sizeable percentage in 35-44. The proportions in these age-periods suggest that persons with University Degrees are looking out for change of jobs after gaining some experience and get settled in the latter periods.

Engineering degree holders are prominent in age-groups 20-24, 25-34 and to a lesser extent in 35-44. Those seeking re-employment in 45-59 are also fairly high. There are no females under this educational level. Males having degree in Medicine are concentrated in 20-24 and 25-34 while for females the age-periods 25-34, 35-44 and 45-59 are important with equal proportions. Males with technology degree or diploma are prominent in 20-24, 25-34 and 45-59. The proportions in the age-period 20-24 to 25-34 for technically qualified persons suggest that they are changing jobs till they reach 45. The proportions in 45-59 suggest that the persons coming under this age-period may be retired persons seeking re-employment as 55 was generally the age of superannuation. For persons with teaching degree or diploma the age-period 25-34 is prominent for males and 25-34 and 20-24 for females. Persons with this educational attainment presumably get settled by the time they reach 35.

The figures under the various educational levels and ages are suggestive of two things (1) the throwing out of persons with lesser educational qualification and (2) the tendency on the part of higher qualified persons to change jobs. Further the emergence of the phenomenon of unemployment among women will also be seen even though the number of unemployed women is not very much.

The tables below will reveal the extent of unemployment among persons aged 15 and over possessing various educational levels in urban areas.

TABLE IX — 28

*Never employed persons aged 15 and above in urban areas expressed as a percentage of total urban population aged 15 and above in each educational level and sex*

**Educated unemployment in rural areas**

30. There are 37,021 males and 2,344 females in rural areas who are unemployed i. e. those seeking first employment and those employed once and now out of employment. Females are mostly engaged in household duties and agricultural occupations and do not generally present any serious problem of unemployment. Underemployment cannot be taken into account correctly as employment in agricultural operations as well as in household industry being seasonal, those out of work for part of the year are not correctly revealed by the Census statistics.

The table presented at the end reveals that unemployment is largely found among those qualified in Matriculation and above standards, since in rural areas, opportunities in establishments and services of non-agricultural occupations will be much less than in urban areas and rural folk have to move to urban areas for suitable jobs. When we see the distribution of rural unemployed among the districts, rural unemployment for males is of some significance in the districts of Chingleput, North Arcot, Salem, Coimbatore, Madurai, Tiruchirapalli, Thanjavur, Ramanathapuram, Tirunelveli and Kanyakumari. Female unemployment is significant in the districts of Kanyakumari, Tirunelveli, Ramanathapuram, Madurai, Chingleput and Tiruchirapalli.

Out of 37,021 males unemployed in rural areas, 13,429 are having Matriculation and above educational level, 9,819 are simple literates and 9,406 are qualified in Primary or Junior Basic level. Of the 2,344 females, 1,428 are having qualification Matriculation and above, 526 are of Primary or Junior Basic level and 156 are simple literates.

Among rural male illiterates who are unemployed the proportions in the districts of Chingleput, Coimbatore, Salem, North Arcot and Tirunelveli are worth mentioning. Among unemployed females who are illiterates, Ramanathapuram, Tirunelveli, Coimbatore, Tiruchirapalli and Kanyakumari are in the forefront. The proportions vary from 6.59% in Tiruchirapalli to 22.19% in Chingleput for males and from 8.12% in Kanyakumari to 31.62% in Ramanathapuram. In the level of simple literates, Tirunelveli, Chingleput, Thanjavur, Coimbatore and Ramanathapuram under males and Kanyakumari, Tirunelveli, Ramanathapuram, Tiruchirapalli, and Madurai under females are the main contributors. The percentage figures for males ranges from 9.04% in Ramanathapuram to 19.72% in Tirunelveli while for females the range is from 6.41% in Madurai to 26.92% in Kanyakumari. Thanjavur, Chingleput, Tirunelveli, Kanyakumari and Tiruchirapalli having percentages from 16.26% to 8.31 under males and Tirunelveli, Kanyakumari, Ramanathapuram, Madurai and Tiruchirapalli under females where the figures range from 26.62% to 6.66% are significant in the rural unemployed with Primary or Junior Basic level. Unemployed males with Matriculation and above standard are prominent in the districts of Kanyakumari, Thanjavur, Tirunelveli, Tiruchirapalli and Madurai. The percentage figures range from 7.97% in Madurai to 18.85% in Kanyakumari. In the same educational level under females, Kanyakumari with 68.42% stands distinct. In the districts of Tirunelveli, Chingleput, Madurai and Ramanathapuram the percentage figures vary from 9.04 to 3.08.

TABLE IX — 30  
*Distribution of rural unemployed among districts classified by educational levels, 1901*

State District	Total unemployed		Percentage		Illiterate		Percentage	
	Males	Females	Males	Females	Males	Females	Males	Females

The southern districts of the State and Chingleput, North Arcot and Coimbatore have more rural unemployment in all the educational levels. The literacy percentages are also higher in the southern districts which have lesser industrial activity. All the districts except Kanyakumari are fairly bigger districts mainly depending on agriculture. As such the unemployed figures are considerable in these districts.

**Distribution of technical degree holders among workers in urban areas by industrial categories**

31. Normally anyone can expect employment of persons with degree in agriculture in categories I and III. In fact, the highest proportions of such persons of both the sexes are to be seen in Category IX — Other Services. Even the proportions in Categories V and VII are higher than in Category I for males. Similarly in the case of persons holding degree or diploma in veterinary and dairying, 905 males out of 1,000 males and all the females are concentrated in Category IX — Other Services. Even the proportions of males in categories V and VIII are higher than that in category I. Engineering degree or diploma holders among

male workers are found mainly in categories V, VI and IX and to a lesser extent in categories V, VII and VIII. Females with this qualification are mainly engaged in IX — Other Services and to a lesser extent in VIII — Transport, Storage and Communications. Degree holders in medicine are mainly to be seen in IX — Other Services. Degree holders in Technology under which only males are seen have an equal distribution in categories V and IX. The high proportion in category IX may perhaps be due to Technologists working in Research Institutions, Colleges and Universities and Government Institutions which come under Category IX. Concentration of Teaching degree holders in Category IX — Other Services is only natural.

The maldistribution of degree or diploma holders in Agriculture, Veterinary and Dairying in categories VII and IX is due to that our young men and women with these qualifications take up any job that comes to them. Further these technical degree holders get into Government departments and become administrative officials and come under the classification IX — Other Services. These facts are revealed in the following Table.

TABLE 13  
Distribution of 1,000 Technical Degree holders of each sex among workers in urban areas by Industrial categories

### Literacy levels of workers other than at Cultivation in Urban areas

32. Table B-VI gives the population of workers other than Cultivator and Agricultural labourer in each sex, broad age-groups and occupational division classified into different educational levels. Subsidiary Table B VI-1 gives the distribution of 1,000 literate workers in each occupational division and in each sex by educational levels in urban areas only. The discussion that follows is based on the figures presented in Subsidiary Table B VI-1. The discussion is at the State level only.

At the State level, among 100 literate workers of each sex belonging to all divisions, 51.9% of males and 48.5% of females are simple literates. 28.6% of males and 28.2% of females are qualified upto Primary or Junior Basic level. Matriculates form 15.7% of male literate workers and 19.0% of female literate workers. 2.5% of males and 1.7% of females are having university degrees (other than technical degree). 0.8% of males and 2.2% of females have technical degrees or diplomas equal to degree or post-graduate degree.

Higher percentage of simple literates of both the sexes is seen in Divisions 4 — Farmers, Hunters, Loggers and related workers, Division 5 — Miners, Quarrymen and related workers and Division 7-8, Craftsmen, Production process workers and Labourers not elsewhere classified. This is natural since for those engaged in these occupations not much education is required. Male workers of Primary or Junior Basic qualification have shown a percentage of 34.9, 33.6 and 30.4 in Divisions 9 — Service, Sport and Recreation workers, 6 — Workers in Transport and Communication occupations and 3 — Sales workers respectively. Among females who are qualified in Primary or Junior Basic level, Division 0 — Professional, Technical and related workers has a percentage of 40.6, Division 9 — Service, sport and Recreation workers has 27.0% and Division 1 — Administrative and Executive Officials has 23.4%. Service, Sport and Recreation workers include servants, waiters, bearers (domestic and institutional), barbers, dhobies, etc. Transport, communication occupations mainly consist of boatmen, boatluskers, transport conductors and drivers, postmen, hackney carriage drivers and hand cart

pullers, etc. Sales workers include petty hawkers, pedlars, shop assistants, pawn brokers and money-lenders. These occupations do not need highly qualified personnel. Hence many literates with Primary or Junior Basic level are found in these occupations. The higher percentage of females of this level in Division 0 may be due to persons working as midwives, health visitors, vaccinators, nurses, teachers in K. G., Primary and Elementary Schools, musicians, astrologers, palmists, etc. for which professions also a high standard of education is not required. Primary school teachers, nurses, and midwives, take their training after attaining the middle school certificate (VIII std.) The higher proportion of females of this level in Division 1 — Administrative and Executive Officials — is rather odd. Presumably, working proprietors of business concerns may be responsible for this.

As can be expected, the highest proportion of 44.6% and 33.7% under males is seen in Division 2 — Clerical and related workers and 0 — Professional, Technical and related workers for literate workers with Matriculation or Higher Secondary qualification. Division 2 also shows percentage of 29.0. For females, Division 2 — Clerical and related workers and Division 0 — Transport and Communication workers show 72.3% and 68.9% respectively. Division 0 also accounts for 39.4%. For clerical and related workers in Government departments, Commercial establishments, banks, insurance companies, etc. the minimum qualification is Matriculation or its equivalent. Secondary grade trained teachers and health and sanitation technicians also require this qualification. Administrative and Executive Officials of Government such as Village Officers, Revenue Inspectors, Gram Sevaks and Grama Sevikas who come under Division 1 mostly have this qualification. Females who come under Division 6 will mostly be telephone operators and receptionists for which also this educational level is required. Divisions 4, 7-8 and 9 have the lowest percentage of literate workers with this qualification and this is quite in order. University degree holders are most prominent among males in Divisions 0 and 1 and to a lesser extent in Division 2. Female literate workers of this level are prominent in Divisions 1 and 2 and to a lesser extent in Division 0. Concentration of

technical degree holders of both the sexes is seen in Division 0 which is natural and to a certain extent in Division 1. Technically qualified personnel are also now-a-days engaged in administrative functions in Government, industrial and commercial establishments.

**Educational standards and occupations**

33. The table given below gives the percentage distribution of urban workers other than at cultivation in each educational level by occupational divisions separately for males and females.

TABLE IX — 32

*Educational attainment by Occupational divisions in Urban areas, each Occupational Division being expressed as Percentage to all Occupational Divisions, 1961*

Occupational Divisions	Illiterate	Literate (without educational level)				Educational level				Technical Diploma not equal to Degree		Non-technical Diploma not equal to Degree		University Degree or post-graduate Degree other than technical Degree

Public sector appears as a poor employer and private sector pays well their technical and scientific personnel. This may be seen from the difference in the figures of income ranges Rs. 400 and above between Public and Private sectors. Income range of Rs. 1000-1999 and Rs. 2000 and above clearly focuses the disparity in the income levels of scientific and technical personnel employed in Public and Private sectors. These trends are seen in all the States. Further, it is seen that those employed in Public sector are less paid in Madras and Kerala than in the other States as more than 75% come under the range of less than Rs. 400 and that for those employed in Private sector, Maharashtra and West Bengal with their vast industrial and commercial undertakings provide better climate of employment. In all the States the income levels of self-employed persons have not been specified.

#### **Administrative statistics relating to scholars and Institutions**

61. Before we conclude this Chapter, it will be of interest to the readers to have an idea of the number of institutions of learning, number of scholars, the distribution of pupils in institutions by race or groups and the expenditure from all sources on education. The administrative data gathered from the Annual Statistical Abstract of the Government of Madras for the years 1957-58 and 1960-61 have been presented below with a brief analysis. The year 1957-58 has been chosen since from that year statistics for the reorganised Madras State is readily available. I do hope the readers will understand the efforts of the State and Central Governments to spread education to all classes of population and the enthusiasm shown by the population in achieving the desired effect.

#### **Institutions of learning**

From the statement presented, it may be seen that during the period 1957-58 to 1960-61, even though there is not much increase under colleges, there is considerable increase under schools. From 27,188 in 1957-58, the number has risen to 30,177 resulting in an increase of 9.90%. Institutions for males have shown an increase of 9.89% over this period and women institutions 11.30% over the same period.

#### **Scholars attending institutions**

Increases are seen in University, Collegiate and Secondary school levels under both the sexes. From 23,83,017 male scholars in 1957-58 the number has risen to 28,61,386 in 1960-61. Under females from 1,241,338 the number of scholars has increased to 1,590,757. The increase under males is 20.07% and under females 28.15%. There has been a good increase under women scholars.

#### **Scholars in different types of educational institutions — University and Collegiate group**

Number of Universities remains constant during the period under consideration. Male scholars in Universities have increased from 3,340 in 1957-58 to 3,927 in 1960-61 and women scholars from 278 to 336 during the period. Scholars of Arts and Science colleges have increased under males from 29,309 to 36,077 during the period and females from 6,095 to 8,380 showing greater spurt in women education. The number of institutions have not shown increase under men while there is a reduction of 1 under women.

Number of professional colleges for women has remained stationary while two more have come up for men during 1957-58 to 1960-61. Looking into the figures of scholars under males, there is an increase of 2,978 or nearly about a third more while under females the increase is 362 or about a fourth during the period under review.

The number of colleges for special education remained constant. The increase is only under women and decrease is seen under men.

#### **School education**

The number of schools imparting general education for boys has increased from 24,817 in 1957-58 to 28,265 in 1960-61. The increase under girls institutions is from 226 in 1957-58 to 254 in 1960-61. Coming to scholars, the number of boys studying in these institutions has risen by 21.38%. The increase under girl scholars is 28.33%.

The number of schools for professional education for boys have shown increase. The number of scholars studying have registered the following increases:

Boys from 40,702 to 46,992.

Girls from 11,677 to 15,393.

Considerable increase for boys and girls is seen under Basic Training Schools and under Industrial schools for boys and under commercial schools for girls.

#### **Schools for special education**

Considerable decrease will be seen both for men and women mainly due to the decrease in adult schools.

On the whole, both the number of institutions and scholars has increased considerably. It indicates the all round educational development of Madras State.

#### **Educational institutions and scholars in rural areas**

The number of colleges and schools has increased from 22,385 in 1957-58 to 25,241 in 1960-61. The increase is 12.31%. When we look into the increase under scholars during the same period it will be seen that the increase comes to 26.68%. Both the number of institutions and scholars have shown a good increase in the rural areas of the State which is the most welcome feature.

#### **Growth of educational institutions by categories of management**

Phenomenal increase is seen under District Board-Panchayat Union managed institutions, while Government and Municipal Council managed institutions show slight increases. There is a decrease under private management institutions during the period 1957-58 to 1960-61.

#### **Attendance**

The percentage of average daily attendance in

1957-58 was 82.12% and this percentage has increased to 85.13%.

#### **Pupils by sex and social groups**

Out of 3,624,355 scholars in colleges and schools in 1957-58, 477,949 or 13.19% belonged to Scheduled classes (Castes) and 11,873 or 0.33% to Scheduled Tribes. In 1960-61, 626,833 or 14.08% out of 4,452,143 scholars belong to Scheduled classes and 16,017 or 0.36% to Scheduled Tribes. Both Brahmins and Indian Christians who were considered most forward in education during the earlier years do not figure now. Brahmins who formed 6.07% of the total pupils in 1957-58 formed 5.72% in 1960-61 and Indian Christians (other than backward) have decreased from 5.19% in 1957-58 to 4.04% in 1960-61. It may also be seen that the proportion of pupils belonging to Backward groups of all religions and Scheduled classes have increased during the period under review thereby indicating the spread of education among people who were considered socially and educationally backward. This also indicates the achievement of the two five year plans in which considerable amount has been spent on the uplift of backward and scheduled classes of population for their welfare especially in the matter of educating the so-called downtrodden sections of the population.

#### **Expenditure from all sources in educational institutions**

The expenditure on direct charges of all institutions has increased from Rs. 1,70,453,517 in 1957-58 to Rs. 2,26,957,484 and indirect charges from Rs. 6,04,96,505 to Rs. 9,03,68,180/-.

## CHAPTER - X

### LANGUAGE

#### General

Mother-tongue is perhaps the more sensitive index of the ethnic origin than is the birth place because linguistic differences tend to persist until complete cultural assimilation has taken place. Important ethnic groups not only among the foreign born but also among the native born can be distinguished by language differentials. This is the view expressed in the Demographic Year Book of 1956. Actually in a country like India, mother-tongue has a greater significance in that it is the language spoken by the mother at home to the child and this language is always associated with the citizen wherever he may be found. It does not necessarily follow that he can read or write that language. To my mind, it is a much more dependable index of the migration of the people than the birth place data we have collected during this Census because birth place can mask or inflate the degree of migration which has taken place. Data on other languages known to the people have also been collected. In our country the question of linguistic minorities and the official language have given rise to a lot of controversy. This problem does not exist in Madras State, but it is still desirable to know the exact segment of population who speak the principal or official language of the State, so that proper safeguards can be given to the linguistic minorities. It also throws light on the bilingual and multilingual potentialities of the population.

#### Questionnaire on mother-tongue and Bilingualism

2. Question 7 in the Individual Slip covered mother-tongue and bilingualism. Mother-tongue has been defined as the language spoken by the person since early childhood. This was elicited under Question 7 (a). Under Question 7 (b) information on any other language or languages, Indian or foreign, known by the person has been elicited. This covers those languages which a person speaks and understands best and can use with facility in communicating with

others. The instructions issued for the enumeration of the mother-tongue and other languages known are reproduced below:—

*Question 7 (a):* Mother-tongue is the language spoken by the person since early childhood. Record the answer given by him even if the language mentioned by him

**Mother-tongue** is a dialect of any of the main languages spoken in the State. In

the case of infants or deaf-mutes, ascertain the language spoken by the mother of the infant or deaf-mute and record it against this question. The following abbreviations may be used to record answers against this question —

T	for	Tamil
A	for	Telugu
K	for	Kannada
M	for	Malayalam
U	for	Urdu
E	for	English

For the other languages, record the languages in full. In the case of dialects of all languages, the dialects may be written in full.

*Question 7 (b):* In addition to the mother-tongue, a person may know some other language or languages, Indian or foreign. This question has been framed with a view to collect the data regarding the language, other than mother-tongue

**any other language (S)** which a person speaks and understands best and

can use with facility in communicating with others. Not more than two such languages should be recorded against this question. These languages should not include dialects of the same language. The following questions may be put in eliciting an answer:—

- i) Do you know any other language? If so, what are the languages?
- ii) Supposing he answers that he knows more than one language, then put this question "Which one do you know

- best"? Record the answers in the order of the languages he knows best ;
- iii) In case of persons who do not know any other language other than their mother-tongue, mark 'X' against this question. The same abbreviations to be used against Question 7(a) will be used here also.

### Precautions taken for correctness of language returns

3. No special difficulty was experienced in the collection of data relating to mother-tongue. A large amount of freedom was given to the enumerator in the sense that he had only to return whatever language was mentioned by the enumerated. It was not his responsibility to classify any language, not even the known languages of the State. Actually, the language was decided by the person enumerated and that is why such languages as Chetti Bashai have been returned. No undue apprehension was expected in Madras State on the possibility of controversy regarding languages. But this aspect was however kept in mind. In order to ensure a complete coverage, early steps were taken to have the instructions issued in regional languages of the State. It covered Kanyakumari, Gudalur and Thalavadi firka of Coimbatore district where the next important regional language was Malayalam. Certain northern parts of Chingleput and North Arcot districts were bilingual in that Telugu was the predominant language. The Tamil-Telugu problem has been amicably settled by the Pataskar Award which the Governments of Madras and Andhra Pradesh accepted on the basis of which the Andhra Pradesh - Madras Alteration of Boundaries Act, 1959 was passed and its provisions implemented before 1961 Census. Gudalur taluk has become reconciled to its retention in Madras State; though historically and culturally it formed part of Kerala, administratively it had remained for a long time as part of Nilgiri. It did not also have a definite majority of Malayalam speakers. As such, apart from the question of ensuring that the persons knowing a particular language was appointed as the enumerator and instructions were issued to him in the language understood by him, no problem of incorrect enumeration of mother-tongue could arise in Madras State. There was a slightly different

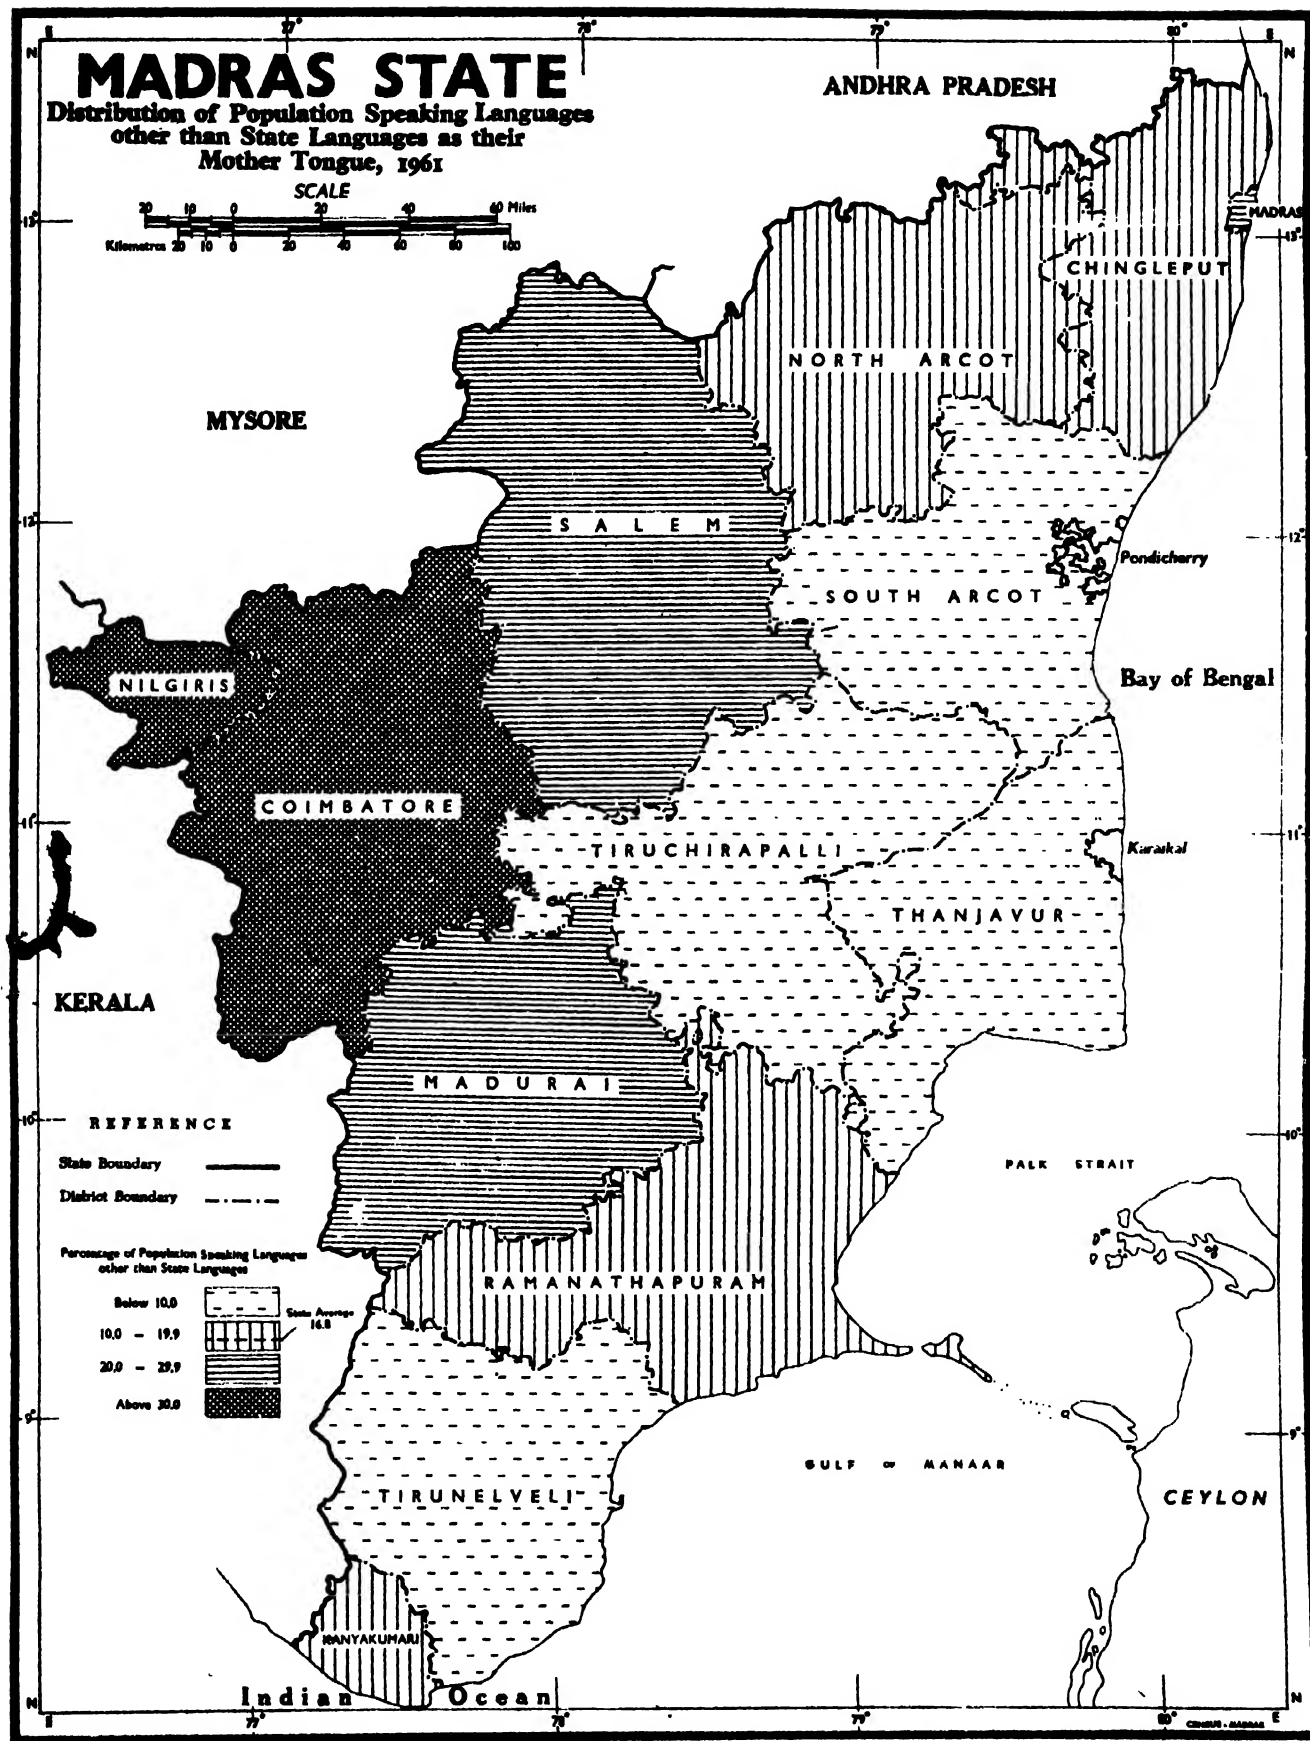

approach in Kanyakumari district. A section of the people talked about the merger of the area with Kerala State more for political reasons than for any other. As such, special instructions were issued to the Collector of Kanyakumari to see that no complaint arose. Actually, there was an allegation that an attempt was being made to change the mother-tongue of persons. But on enquiry it was found that it was more a mischief mongering than a reality. The question of the language playing an important part in the adjustment of boundaries of Madras State did not arise at any stage throughout this Census; nor would it be correct to say that any bias was shown by the enumerators. Actually, in the minority taluks of the State, the enumerators knowing the minority language and their supervisors knowing one majority language were appointed and so no problem of any intentional bias could arise. No return has been vitiated by the ignorance of the enumerator. In certain cases of the enumeration some dialects returned have been based on what the enumerator told him. Also as the language has to be recorded as given by the enumerated, sometimes mispronunciation has crept in our returns. For instance, Badaga has been returned as Badaga. It was our endeavour to see that enumerator did not have any discretion in the matter of classifying the languages. The classification was later done by us in consultation with the Linguist at Calcutta.

### Unilingual Madras

4. Madras is essentially a unilingual State with Tamil as the language spoken by approximately 83% of the population. Nor is any district included in the State where a language other than Tamil forms the major language. Nor will any taluk be found in which more than 50% of the people speak any other language. As such, the administration can be conducted in Tamil language, towards which specific measures have been taken by the Government of Madras. There is also an attempt to see that University education is imparted in the regional language, viz. Tamil for which a Pilot Scheme is under operation in the Government Arts College, Coimbatore. Whatever be the future of English, it remains an

# MADRAS STATE

Distribution of Population Speaking Languages  
other than State Languages as their  
Mother Tongue, 1961

undisputed fact that in due course Tamil will develop as the language of Madras State for all matters relating to its administration, education and other activities. But still there are large components consisting of other language groups belonging to Dravidian Group, to the North Indian Group and Foreign Groups who have played an useful role in the enrichment of the culture of the State of Madras. It is, therefore, necessary to analyse what exactly is the composition of different important languages spoken in Madras State and how they are distributed in the different districts. Historically, the growth of Madras is linked with the close association of the Telugu speaking people and to a lesser extent Kannada, Malayalam and Oriya speaking people. Actually in 1901 the State of Madras represented a polyglot of 5 principal languages spoken in India and an area composed of different language groups but administered from Madras. In 1951 Census four such languages remained of which Telugu and Tamil were the principal ones. With the Linguistic Reorganisation of the State, the importance of other languages has decreased to a substantial extent, but it still is of interest to find out how the linguistic reorganisation has effected the dispersal of the language groups in what today constitutes Madras State.

### Bilingual belts

5. The linguistic composition of Madras State has a definite pattern. This discussion is based on the linguistic figures of the rural areas of the districts. With the singular exception of Gudalur taluk in Nilgiri district and Hosur taluk of Salem district, all other taluks have a Tamil majority. Gudalur was a part of Malabar district in the 19th century and was for administrative reasons transferred to Nilgiri. As part of Nilgiri district, it developed as an important economic unit and as such was retained as part of Madras State. Similarly, Hosur taluk rural area has a Telugu percentage of 37.07 and a Kannada percentage of 31.34. It is actually a trilingual Taluk. As no other language had a majority in that taluk, the question of its transfer to Andhra Pradesh or Mysore on linguistic grounds did not arise. As such, Gudalur constitutes the only unit where rural population speaking Malayalam form 56.91%. The Tamils are in a minority.

### Linguistic division of the State or language pattern of the State

6. In the map attached two regions are shaded - one rural areas of taluks in which a language other than Tamil is spoken by more than 15% of the population and the second rural areas of taluks where another language is spoken by 10 - 15% of the population. It will be seen that Madras State may be divided into two broad divisions - the eastern portion in which Tamils are in absolute majority and the western portion in which the other linguistic groups are found. The western portion consists of the northern - most taluks of Chingleput and North Arcot, major parts of Salem district, the entire Coimbatore and Nilgiri district, Madurai district with the exception of two taluks and Western Ramanathapuram and western portion of Kanyakumari district. Tamilnad has never been insular in its history. Tamils have expanded towards North and had been in constant communication with other linguistic groups in India. In her later history, Tamils have been ruled by Kannadigas, Telugus, and Marattas with the result that large movement of population has taken place towards certain parts of Tamilnad. It is, therefore, likely that with constant communication with other linguistic groups, a belt of bilingual areas has developed towards the northern and western parts of this State. The area covered by 15% and more population of Telugus are three taluks of Chingleput Ponneri, Tiruvallur and Tiruttani; Arkonam and Gudiyatham of North Arcot and Hosur and Krishnagiri of Salem district. This is not surprising because they, except Hosur, adjoin the boundary of Andhra Pradesh. The two regions were administered with Madras as headquarters for one and a half centuries and there has been intermingling of the races along the border. We get a Kannadiga majority in Hosur bordering Mysore State in addition to Telugus and in Avanashi taluk of Coimbatore district. Gopichettipalayam and Coimbatore taluks have a fairly large amount of Kannadigas—14.79% and 15.92% respectively—though the Telugus dominate with 20.11% and 26.40% respectively. Kannadigas are also found in Pollachi with 10.12%. The influence of Kannadigas is limited to Coimbatore and a portion of Salem district. The Kannadigas appear in another form as Badagas which language forms

39.16% and 33.67% of Coonoor and Ootacamund taluks of Nilgiri district. Actually they represent people who have migrated four or five centuries ago when Mysorians were in power. The large influx of Kannadigas in Coimbatore district can also be explained by the domination which the Hoysalas had over these territories when the power of Cholas declined in South India. Telugus are also found as a major minority community all along the western belt in Gopichettipalayam, Avanashi, Coimbatore, Palladam, Pollachi and Udumalpet taluks of Coimbatore district; Palni, Kodaikanal and Periyakulam of Madurai district; Srivilliputtur, Sattur and Aruppukkottai of Ramanathapuram district and Kovilpatti of Tirunelveli district. In the adjacent taluk of Sankaranayinarkoil a high percentage of 11.7 is seen. Along with this is a belt running from Dharmapuri to Tirumangalam taluk of Madurai in which Telugus are found between 10-15%. It will thus be seen that there has been a definite movement of Telugus along the western portion of the Madras State, perhaps due to the domination of the Vijayanagar Empire over South India and the establishment of Nayak dynasty in Madurai. Actually, the Poligars from whom the British

conquered these areas were Telugus in Origin. After this we have Kanyakumari district which was transferred on linguistic considerations to Madras State. In that, one taluk Vilavancode, the western most, has 21.83% of Malayalees. The next taluk of Kalkulam has 13.96% of Malayalees. As already indicated, with the exception of Malayalees forming an important linguistic group in three taluks of Madras State, all other linguistic groups have lived in Madras State for centuries and identified themselves with the State itself. Their language of instruction is generally Tamil. This aspect will be highlighted when we discuss the bilingualism of the linguistic groups. The only exception to this general observation will be Madras City in which a large number of Telugus are found which number has decreased consequent on the formation of Andhra State. The district of Thanjavur, nine taluks of Tiruchirappalli, South Arcot district and eastern parts of Ramanathapuram and southern parts of Tirunelveli, 3 taluks of Salem, 2 eastern taluks of Madurai and southern taluks of North Arcot and Chingleput form the distinct Tamil belt which actually extend beyond the sea in the northern portion of Ceylon.

TABLE X — I

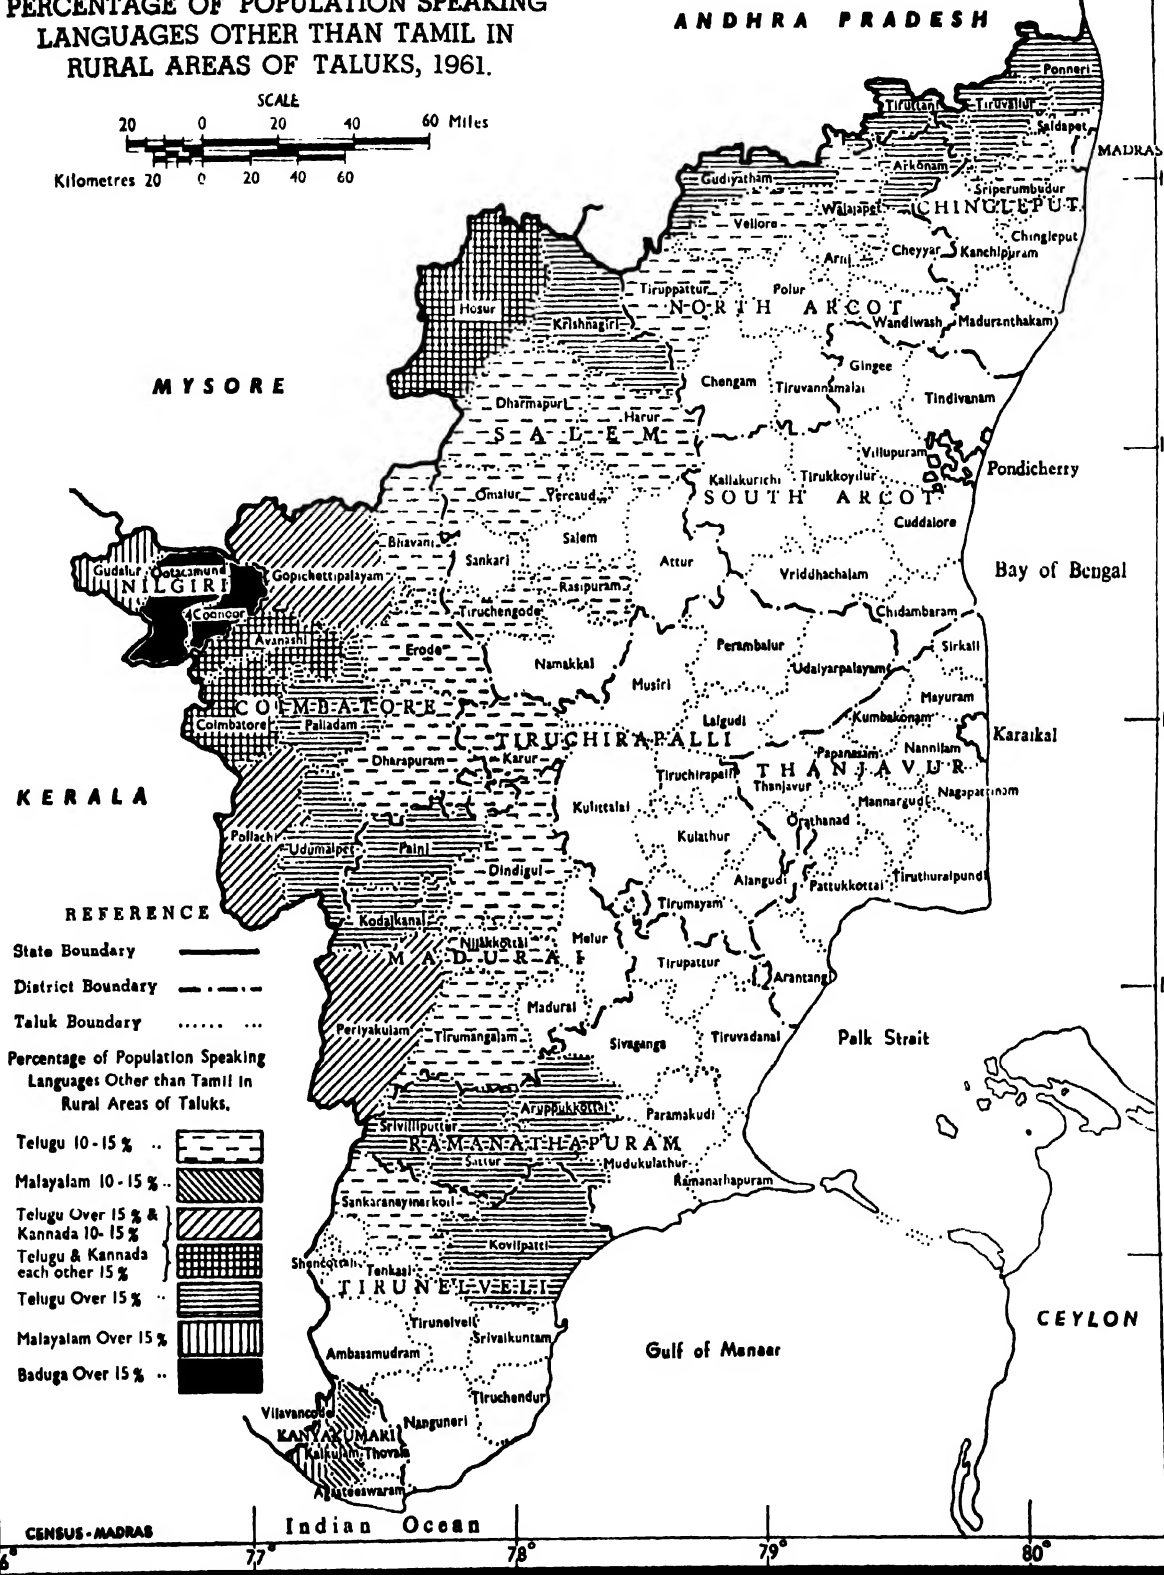

*Distribution of population of Madras State by main Mother-Tongues from 1901 to 1931; 1951 & 1961*

Year	Total Population	Tamil	Telugu	Malayalam	Kannada	Oriya	Others
1	2	3	4	5	6	7	8
1901	36,623,066	15,543,383	14,315,304	2,854,145	1,530,688	1,809,336	2,570,210

### Linguistic History of Madras from 1901

7. Table X-1 illustrates the linguistic composition of Madras State from the beginning of this century. In 1901 it had a population of 40.24% of Tamils, 37.06% of Telugus, 7.39% of Malayalees, 3.96% of Kannadigas and 4.69% of Oriyas. These were the five chief languages spoken in the State. It was an administrative unit covering the bulk of the Southern Peninsula, but excluding the native State of Mysore, the British Province of Coorg and the two native States of Travancore and Cochin. Again, three small principalities of Pudukottai, Banganapalle and Sandur were enclaved in the State. The first step in the disintegration of the State was taken with the Government of India Act, 1935 when the State of Orissa was formed. As a result of this, the percentage of Oriya population dropped from 3.92% to 0.29%. However, the major changes that transformed the administrative unit into unilingual State took place between 1951 and 1961. The first was the formation of Andhra State, the second was the formation of Kerala and bigger Mysore State. As a consequence of this, the Tamil population of the State rose to 83.15% with Telugus constituting 9.98%, Malayalees 1.19%, Kannadigas 2.53% and Oriyas practically disappearing from the State. The machinery with which the Presidency was administered in 1901 has, however, been bequeathed to the residual Madras State. What constituted 22 districts has been reduced to 13, but the executive authority is still vested in a Collector and the districts are subdivided for administrative purposes into taluks, the chief executive officers of which are called Tahsildars. In this reorganisation, the Princely States of Travancore-Cochin, Coorg and Mysore have disappeared. Principalities of Banganapalle, Pudukottai and Sandur have been merged, the first with Andhra Pradesh, the second with Madras State and the third with Mysore. Thus a more consolidated State has been formed which is the southernmost in India.

It will be interesting to examine the linguistic composition of the districts constituting the present State. The districts of South Arcot, Tiruchirapalli, Thanjavur, Ramanathapuram, Tirunelveli and Kanyakumari are in its real sense Tamilian in character. The lowest Tamil popu-

lation is recorded in Nilgiri with 38.56%. Population speaking Badaga form 20.7% and Malayalees constitute 15.79%. The other districts which record a lower percentage of Tamil are Salem, Coimbatore, Madurai and North Arcot. Proximity to the Kannada speaking and Telugu speaking areas and the role which Mysore has played in the history of northern and western portions of Madras have resulted in the prevalence of a higher percentage of Telugu speaking and Kannada speaking people in these districts. The only exception to this is Madurai district which has 12.50% of Telugus. They, however, represent people who have migrated centuries ago along with the Nayaks and settled and have identified themselves with the local people. Actually, 9.98% of the Telugus and 2.53% of Kannadigas who constitute the major minority linguistic communities of this State have for centuries identified themselves with Tamilians and have taken to Tamil language as the medium of instruction. As such, they are not alien to the State of Madras.

Though Madras State lost 47.17% of its population chiefly consisting of Telugu, Kannada and Malayalam speaking people during the decade 1951-61, the districts now forming part of Madras State remained more or less unchanged, with the difference that Kollegal taluk of Coimbatore district was transferred to Mysore State. As such, the actual number of speakers of Kannada declined in the present Madras State when compared with 1951. Another important change is the inclusion of the newly formed Kanayakumari district in Madras State carved out of the former Travancore-Cochin. For the purpose of this discussion, we have ignored the inter-State transfer of villages between Andhra Pradesh and Madras State consequent on the implementation of the Pataskar Award. We have calculated the population for the 12 districts which existed in 1951 and 1961 which amounts to 29,227,156. The following Table X-2 gives the status of 4 principal Dravidian languages spoken in Madras State during the decade 1951-61. It gives the status of each Dravidian language among the State total and the status of each Dravidian language among the total population of Dravidian languages. The numerical strength of the principal Dravidian languages has increased except for Kannada. It

has suffered a fall of 0.56%. Among other languages, Tamil has increased by 1.20% and

Malayalam by 0.59% Telugu has also suffered a fall of 1.31%.

TABLE X — 2

*Population covered by four major Dravidian languages of the state in 1951 & 1961*

Dravidian languages	Population of each Dravidian language		Percentage of population		Percentage of each Dravidian language among the Dravidian population	
	1951	1961	1951	1961	1951	1961
1	2	3	4	5	6	7
Tamil	23,952,520	28,011,099	81.95	83.15	84.48	85.85
Telugu	3,299,743	3,363,579	11.29	9.98	11.64	10.31
Kannadam	902,385	853,211	3.09	2.53	3.18	2.62
Malayalam	199,621	399,206	0.68	1.19	0.70	1.22

*Note:*—In working out the figures for 1951 the figures for the districts of the composite Madras State and areas forming part of the present Madras State have alone been taken into account without effecting any adjustment for changes in their jurisdiction on account of S. R. Act or the Andhra Pradesh – Madras (Alteration of Boundaries) Act, 1959. The figures for Kanyakumari districts which are not available have also not been taken into account for 1951.

### Classification of language

8. As indicated earlier, the linguist has reclassified 195 languages returned in Madras State and reduced the number to 159. The process employed was to merge the synonymous languages. The names of languages thus deleted with the number of speakers against each language and the name of the language with which the merger took place are indicated in the statement given below.

TABLE X — 3

*Languages deleted from the final list of languages showing the number of speakers and the names of languages with which they are merged.*

Names of languages recorded which have been deleted in the final list	Names of languages with which merged	No. recorded in each of the deleted language			
1	2	3			
1. Annamite*	Annameese	2	5. Pakadi	Pahari	13
2. Badagu	Badaga	75,559	6. Blumese	Flemish	1

			41. Pallakkal	3	" " Badaga.
			42. Roman	4	Unclassifiable.
			43. Satrali	9	" "
			44. Sigitvia	1	" "
			45. Sikhi	2	Merged with Punjabi.

In the case of languages marked with an asterisk, the merged language has also been shown along with the main language in the Table published by us. 9 such languages retained are

Kabuli  
Pathani  
Annamite  
Simelu  
Jewish  
Mizo  
Maldivian  
Malayan and  
Thai

The total number of languages thus deleted by the Linguist will come to 36, though the names of these 9 will be exhibited along with the main language. The total number of speakers covered by this reclassification is 77,223. Of these, 75,559 persons speak Badagu. Badagu is the name under which they have been returned. The difference between Badagu and Badaga is the difference of pronunciation and does not affect the language classification. Thus, the number of speakers affected by this classification, if Badaga is excluded comes only to 1,664 persons.

A further list has been prepared giving a list of languages which perhaps can be merged with the appropriate main language. This is based on a discussion with Linguist. The names of such languages are indicated below :

46.	Sikkari	29	Merged with Kuruvikkaran
47.	Sudanese	4	„ „ African.
48.	Theevari	2	„ „ Telugu.
49.	Udaiyarmoli	4	„ „ Tamil.
50.	Uganda	5	„ „ African.
51.	Vadugu		
	(Vadaga)	235	„ „ Telugu.
52.	Vaipaki	1	Unclassifiable
53.	Valluvamoli	3	Merged with Tamil.
54.	Yerukula	25	„ „ Korava.

The total number of speakers of these languages comes to 3,561.

The following are the languages spoken in Madras State :

Language	No. of speakers
1. African	21
2. Annamese	3
3. Arabic	639
4. Assamese	70
5. Austrian	1
6. Badaga	85,374
7. Balinese	1
8. Basque	18

#### Major Languages of the State

9. Tamil, Telugu, Kannada, Urdu, Malaya-

lam, Saurashtra, Badaga, Hindi and English are the important languages. In addition to these, there are 17 languages which are spoken by more than 1,000 people and they are listed below :

1. Bangali
2. Gujarathi
3. Irula/Iruliga
4. Konkani
5. Kuruba/Kurumba
6. Lamani/Lambadi
7. Marwari
8. Montadanchetty
9. Naiki-Kuruba/Kurumba
10. Nepali
11. Pania
12. Punjabi
13. Sindhi
14. Solaga-Kannada
15. Tulu
16. Urali
17. Marathi

It will be seen that other 169 languages are spoken by a negligible number of people and will not be of adequate interest for a detailed analysis. Of the 9 important languages, Tamil, Telugu, Kannada and Malayalam constitute the four major Dravidian languages of India. Saurashtra is a language spoken by the weaving community of Madras State who have migrated centuries ago from Saurashtra and is said to be allied to an earlier form of Saurashtra language. Badaga is a language spoken by the people of Kannada origin of Nilgiri and is allied to Kannada. Urdu is the language of the Muslims inhabiting the Madras State including those who have migrated from outside. Hindi is the national language of India and persons who speak this language have actually migrated from other States. English was the language of administration and is spoken by a large number of Englishmen and American who have come to work in various industrial and commercial establishments located in Madras State and by Anglo-Indians. This more or less summarises the linguistic pattern of the State. Tulu which used to be spoken by the South Kanara people who have migrated to Madras State has lost its importance after States Reorganisation.

#### Language Families

10. I have further classified the languages both Indian and Non-Indian into 9 major families,

TABLE X — 4  
*Classification of important languages familywise*

Family Sub - Family	Branch Sub Branch	Group	Language/ Dialect
1	2	3	4
I. Dravidian family	...	Dravida Group	Tamil Irula Korava Koraga Malayalam Paniya Kannadam Badaga Kurumba Solaga Urali Toda Kota Tulu Coorgi or Kodagu Chettibashai Monta.lanchetty
		Andhra Group	Telugu
II. a) Indo-European (Indian) Family, Aryan Sub family	Dardic or Pisacha Branch	Dard Group	Kashmiri
	Indo-Aryan Branch, Sanskrit Sub-Branch	Sanskritic Group	Sanskrit
	Indo-Aryan Branch Outer Sub-Branch	Southern Group	Marathi Konkani Goanese Prakrit Karuvikkaran

	Celtic Branch		Gaelic Irish Scottish Welsh
	Balto-Slavic Branch		Czechoslovakian Polish Russian Slovene Yugoslavia** Greek Belgian
IV. Tibeto-Chinese Family		Tai Group	Siamese Annamese
Siamese-Chinese Sub-Family			Vietnamese
	Tibeto-Himalayan Branch	Tibetan Group	Sikkim Bhotia Tibetan Bhutani

\* (There is no such language as Swiss. German, French, Italian and Rumansh are the most predominant and official languages of Switzerland. Out of 4.5 million people, over 3 million Swiss speak German 'The World's chief languages' by Mario A. Pei, p. 48)

\*\* Mario A. Pei does not seem to have observed the language "Yugoslavia". Serbo-Croatian and Slovene are the main languages spoken in Yugoslavia and hence it is included in the Balto-Slavic Branch.

**TABLE X — 4 (Contd.)**

		<b>Unclassified</b>	Bithalanean Roman Satrali Sigitvia Vaipaki

*Note* :—The language Pahari is not included in the classification since the Linguist has treated the return as unspecified.

As regards the language “Basque”, it is not clear to which family it belongs. Dr. N. Lahovari who has done a great deal of research on this

language has pointed out the affinity between it and Dravidian languages.

TABLE X — 5

*Distribution of population by linguistic families and their percentages to total population*

Linguistic family	No. of languages	Number of speakers	Percentage of speakers

<sup>@</sup> This family besides African (3), includes the languages—Congolese (2), Ghanese (7), Sudanese (4) and Uganda (5)

### Speakers of Indian Languages

11. Indian languages have been grouped under two main heads—Dravidian and Indo-European. The former consists of 18 languages spoken in the State, while the latter includes 26 languages enumerated in the region. With the exception of 40,096 persons in the State, all others speak Dravidian and Indo-European (Indian) groups of

languages. 97.19% speak Dravidian languages and 2.69% Indo-European languages of Indian origin. Even Indo-European languages of non-Indian origin are spoken only by 0.11% of the population.

The Table below gives the details of important Dravidian languages with the total number of speakers and the percentages of total speakers :

TABLE X — 6

*Speakers of languages in the Dravidian family and their percentage to the group total*

Languages of the Dravidian family	Number of persons	Percentage to total speakers of the group
1	2	3
Badaga	85,374	0.26
Coorgi or Kodagu	627	N
Irula	4,144	0.01
Kannada (including Chetti-bashai, Mentadan Chetty, Solaga & Urali)	858,620	2.62
Korava	876	N
Kota	956	N
Kurumba	3,834	0.01
Malayalam (including Paniya)	404,346	1.24
Tamil	28,011,127	85.56
Telugu (including Vadaga)	3,363,834	10.28
Toda	760	N
Tulu (including Koraga)	4,686	0.02
	<b>32,739,184</b>	<b>100.00</b>

(N—denotes negligible figures)

Tamil is the most important of this group constituting 85.56% of the total Dravidian speakers. Next is Telugu with 10.28%. Kannada is spoken by 2.62% and Malayalam by 1.24%. The speakers of other languages are negligible in number with the exception of Badaga under which language are found 85,374 persons constituting 0.26%.

#### Indo-European Languages of Indian Origin

12. 26 languages are grouped under the Indo-European languages of Indian origin. The total number of speakers is 907,673 constituting 2.69% of the total speakers of all languages. The statement below will give details of languages belonging to this group which have a minimum speaking strength of 100 :

TABLE X — 7

*Speakers of languages in the Indo-European (Indian) family*

Languages of the Indo-European (Indian) family	Number of persons	Percentage to total speakers of this group
1	2	3
Bengali	2,498	0.2752
Goanese	126	0.0139
Gujarati	17,978	1.9807

Kurivikkaran	60	
	<b>340</b>	

17 languages have more than 100 speakers. The most important language is Urdu which has 67.81% of the total Indo-European (Indian) speakers. A large number of the Muslim population are of indigenous origin with Tamil as their mother tongue. There is a small percentage of Urdu speaking people. A tendency has been seen of late for Muslims to return Urdu as their language. This has been reflected in the increase in the number of Urdu speakers (to which a reference has been made earlier) at the expense of Hindi and Hindustani. Whatever the position be, Urdu is a language of the Muslims, more so in the urban areas of the State. There are institutions in Madras State devoted to the study of Urdu language.

The next language of importance in numerical strength is Saurashtra. This language, though of non-Dravidian origin, is practically confined to the State and is spoken by the weaving community known as Pattu Noolkar who are also known as Saurashtras. Their original home is somewhere in Gujarat. They have in the course of the centuries wandered from place to place and finally settled in Madras State in the southern districts, chiefly in Madurai. It has a large number of Dravidian words borrowed more from Telugu. It has some interest for Philologists, but as a language useful in daily life, it has only a limited application and the Saurashtras speak this language among themselves, for they depend on Tamil for their communication with others.

Marathi is the next important language spoken by a large number of people. 52, 623 speakers of this language are found in the State. They chiefly belong to Madras, North Arcot, Thanjavur and Salem districts. It recalls to mind the occupation of the Marattas and the establishment of a kingdom in Thanjavur. The next important language is Hindi. Hindi as it is, is not spoken as mother-tongue by the indigenous people. They form a language of the migrants who have moved into Madras during the last decade in appreciable numbers and in the earlier decade in smaller numbers. Actually, our data show a decrease in the number of Hindi speakers in Madras State. It is due to the fact that there has been an attempt by some Urdu speaking people to return themselves as Hindi or Hindustani speaking people in 1951. In 1947

consequent on the creation of Pakistan there were lot of unrest and tear in the country. Whatever apprehension was then felt has disappeared now and the citizen has now returned his language as he wished to have it.

A number of Gujarati speaking people are also found in this State who number 17,978. Gujaratis have always been interested in this State for trade

and of late industrial expansion.

### Non-Indian Language

13. Speakers of non-Indian languages form a very small percentage of the total population. Their contribution to the State is however, significant. Non-Indian languages in the State have been classified in the following Table :

TABLE X — 8

#### *Speakers of Non-Indian languages by families*

Linguistic family or group	No. of persons speaking languages included in the group	Percentage to total number of persons speaking non-Indian languages
1	2	3
Total speakers of non-Indian languages	40,080	100.00
Indo-European languages (non-Indian & foreign)	37,920	94.61
Tibeto-Chinese	496	1.24
Austrie	908	2.27
Semito-Hamitic	661	1.65
Japanese-Korean	66	0.16
African-Negro	21	0.05
Ural-Altaic	8	0.02

It will be seen that 40,080 speakers are found speaking non-Indian languages. Of these, Indo-European languages of Non-Indian origin constitute 94.61%. Next comes the Austrie language with 2.27%. Ural-Altaic and other languages are insignificant. If languages which have a spoken strength of fifty or more are taken into consideration, the Indo-European (Non-Indian) language group consists of 14 languages. Their strength varies from 55 under Portuguese/Swedish to 34,447 under English. English accounts for 90.84% of speakers belonging to this group and 85.95% of speakers speaking non-Indian languages within the State. The composition of Indo-European languages is given in Table 9.

TABLE X -- 9

Belgian	2	
	197	

Among the Tibeto-Chinese group, the Chinese language is the most significant. It represents 39.11% of the total speakers. Other languages included are Burmese, Siamese, Annamese, Vietnamese and Tibetan. Ten languages falling under this group are spoken in the State. But

their combined strength is only 496.

Javanese and Malay are grouped under Austric languages. The total strength of the group is 908. Semito-Hamitic languages have a strength of 661. Arabic is the most important language of this group and it accounts for 96.67% of the speakers of this group. Other non-Indian language groups returned are African Negro, Japanese-Korean and Ural-Altaic languages. Of these, the first has a spoken strength of 21, the second 66, while the third group has a following of only 8 in the State.

#### Subsidiary languages

14. The prevalence of subsidiary languages will prove an interesting study. 5,269,121 persons in the State forming 15.64 % know a language other than their mother-tongue. The percentage varies considerably from one language to another. For instance, it is 76.04% among Saurashtra speakers and 5.67% among the Tamils. The inset table below will give the percentage of bilingualists among the numerically important language groups of the State :

TABLE X - 10  
*Bilingualists among important mother-tongue  
 speakers in the State*

Mother- tongue groups	Total speakers	Speaker with subsidiary languages	Percentage of column 3 to 2
1	2	3	4
Total speakers	33,686,953	5,269,121	15.64
Badaga	85,371	34,665	40.61
English	34,446	19,805	57.50
Gujarati	17,929	11,342	63.26
Hindi	38,974	22,662	58.15
Kannada	853,211	573,572	67.23
Malayalam	399,206	173,333	43.42
Marathi	51,431	36,695	71.35
Saurashtra	155,392	118,156	76.04
Tamil	28,011,099	1,587,552	5.67
Telugu	3,363,579	2,295,556	68.25
Urdu	615,503	364,382	59.20
Others	60,812	31,401	51.64

Note : The figures presented above are those returned under each language and do not include the figures for languages that have been merged with the above languages.

Languages with a strength of 10,000 or more have been taken into consideration. All other languages have been grouped together and treated as 'other languages' in the Table. The markedly low percentage of bilingualists among Tamils and a comparatively higher percentage among other language groups will show that bilingualism is more due to necessity than to any other factor. Naturally, Tamils have recorded a low percentage of bilingualism (5.67) which is lower than the State bilingualism by 9.97%. More important languages of Dravidian groups have the following percentages: Telugu, 68.25, Malayalam, 43.42 and Kannada, 67.23. One factor which will explain the higher percentage of bilingualism among Telugu and Kannada speakers is that they are indigenous to the land and many do not actually know to read and write their mother-tongue.

Though Badaga is not a written language, it shows a percentage of 40.61 under bilingualism. It is because Badagas are not as educated as other language group people.

The percentage of bilingualism among all language groups is higher except for the State language viz., Tamil. With the introduction of Tamil as the language of education and language of administration, it is but necessary that all linguistic groups residing in Madras State have to adopt sooner or later the language of the State. Even in cases where the majority of the people speak another language and even if adequate provisions for education in that language are provided in the State, bilingualism is bound to grow at a rapid rate. The fact remains that basically Madras is a Tamil State whatever be the mother-tongue of the citizen, and it is necessary for him to know that language if he has to function as a useful citizen of the State and have all the privileges accruing as a result of that citizenship.

#### Popularity of Tamil and English as subsidiaries

15. Among the subsidiary languages used in the State, Tamil and English are the most popular. 64.62% of the total speakers who use a subsidiary language use Tamil while English accounts for 23.32%. We have indicated how Tamil is popular among other language groups. Not only has Madras been ruled by the English for more than two and a half centuries, but also the educational development of the region has been

mainly through the medium of English. Under the British administration, Madras had people speaking four or five languages. It was out of necessity that Madras had to use English for its medium of instruction. The legacy created on the basis of English was to some extent shattered when it was decided to use the regional language as the medium of instruction. With the appearance of the States of Mysore, Andhra Pradesh and Kerala in the Southern Peninsula, the role which English played as a uniting factor of South Indian State disappeared to a large extent, but as a result of the advance of Hindi as the National language of India, the role of English in the States has increased. There is a greater effort to appreciate this language and study its fine features. The intense love for the regional language has somewhat been sobered by the thought that English as an international language will open the minds of the Indians not only to great literature, but also to science and culture of the world. The table gives the details of bilingualism among the speakers :

TABLE X — 11

*Proportion of bilingualists knowing English and Tamil among major mother-tongue speakers*

Mother-tongue languages	Percentage of bilingualists knowing English to total bilingualists	Percentage of bilingualists knowing Tamil to total bilingualists
1	2	3
Total speakers	23.32	64.62
Badaga	1.90	97.94
English	...	85.00
Gujarati	38.79	36.90
Hindi	24.58	69.67
Kannada	1.78	89.97
Malayalam	24.20	73.77
Marathi	12.51	75.80
Saurashtra	1.84	97.41
Tamil	67.81	...
Telugu	2.33	96.08
Urdu	5.21	89.61
Others	33.00	48.35

In general, preference is shown to Tamil, but this is seen more among persons speaking the Dravidian languages. 23.32% of the bilingualists speak English. It varies from one language to another. Badaga, Kannada, Marathi, Saurashtra, Telugu and Urdu have recorded lower percentages under English as subsidiary. The percentage of Tamil knowing bilingualists among all groups is

64.62. Only Gujarati has recorded a lower percentage, viz. 36.90. The highest is recorded by Badaga with 97.94%.

Table below gives the distribution per 10,000 speakers of major mother-tongues of Tamil and Telugu in the State who speak also one or more subsidiary languages for each district.

TABLE X — 12

### Female proportions among various language groups

16. The inset table below presents data on the proportion of females per 1,000 persons among the various language groups in the State.

TABLE X — 13

*Proportion of females per 1,000 Persons among major mother-tongue speakers and bilingualists under each mother-tongue*

Mother tongue	Proportion of females per 1,000 persons among			
	Total population	Persons with subsidiary languages	Persons with English as subsidiary language	Persons with Tamil as subsidiary language
1	2	3	4	5
Total speakers	498	416	240	478
Badaga	496	301	96	305
English	506	505	...	510
Gujarati	430	370	279	446
Hindi	439	384	214	435
Kannada	497	480	242	487
Malayalam	431	343	305	358
Marathi	490	468	251	506
Saurashtra	498	482	124	490
Tamil	499	297	237	...
Telugu	498	481	228	488
Urdu	490	445	237	458

Except under English, proportions of females per 1,000 persons among bilingualists is lower than the proportions of males. Among total bilingualists, the proportion is found to be 416. The lowest proportion is recorded by Tamil—297. The highest proportion is 505 under English. The proportion of females per thousand persons among bilingualists using English is also found to be low. The total bilingualists who use English record a female proportion of 240. The lowest is recorded by the Badaga group. 96 and the highest by Malayalam, viz. 305. The table also gives data on the proportion of females among Tamil speaking bilingualists.

### Linguistic proportions in 1951 and 1961 for major languages

17. The Table below gives the number of persons per 10,000 of population speaking each recorded language as mother-tongue.

TABLE X — 14

*Number per 10,000 of total population speaking each recorded language as mother tongue in the state*

Language	Number per 10,000 of total population	
	1961	1951
1	2	3
Badaga	26	23
Bengali	1	1
English	10	10
Gujarati	5	4
Hindi	12	22
Kannada	253	301
Malayalam	119	118
Marathi	15	18
Saurashtra	46	41
Sindhi	2	2
Tamil	8,315	8,192
Telugu	999	1,098
Tulu	2	1
Urdu	183	142

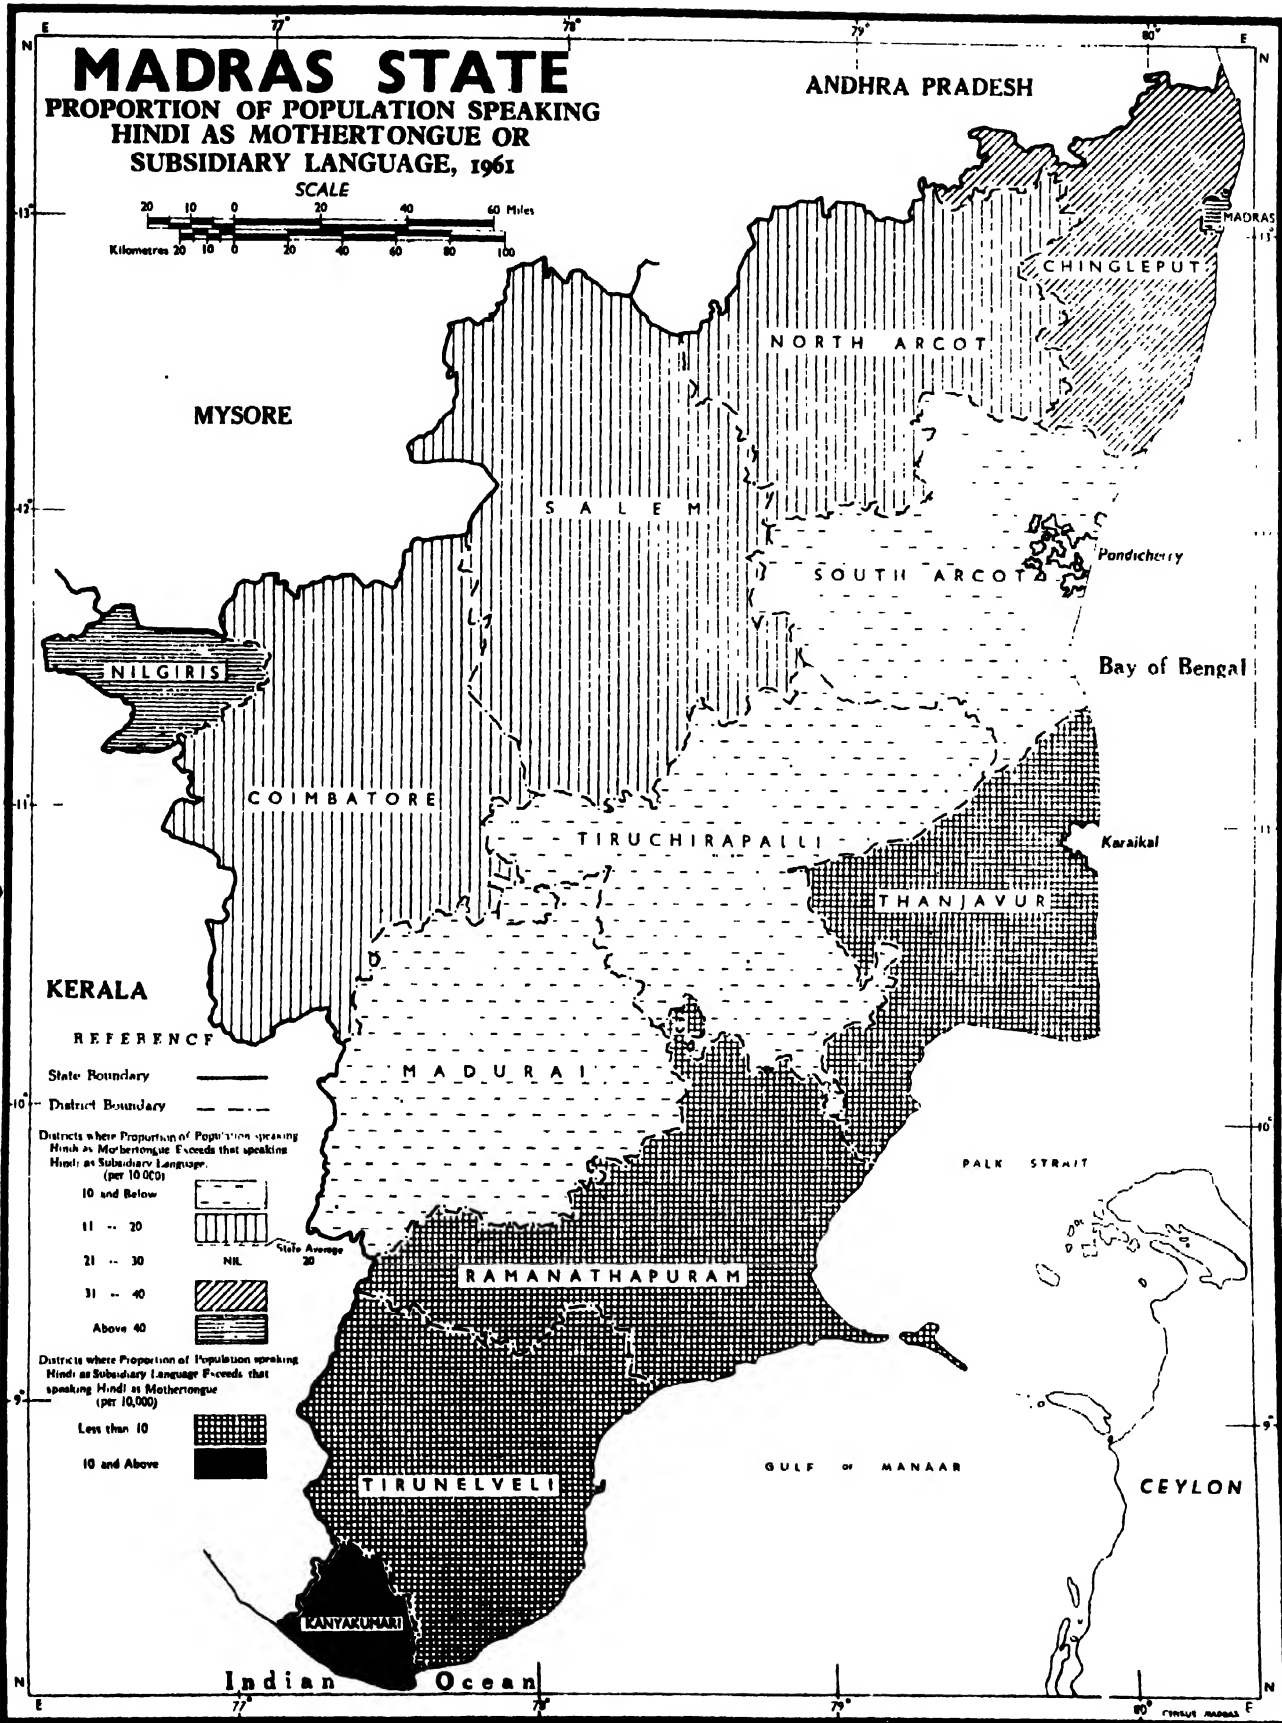

Note: (See note under Table X - 2)

Those languages whose proportions are negligible both in 1961 and 1951 have been excluded from the Table.

The following points are of interest. The percentages of Bengali speaking, English speaking and Sindhi speaking persons have remained stationary. The number of Badaga people has increased from 23 to 26. Badaga speaking people are found only in Nilgiri district and this increase should be attributed to natural increase in population. Saurashtras have increased from 41 to 46. The bulk of them are found in Madurai district. This increase should be attributed to the natural

10 and Above

growth of the Saurashtra community. No fresh addition by migration can be expected. Among the other major groups are Telugu, Kannada and Malayalam. Telugu has recorded a fall from 1,098 to 999. It indicates the gradual reduction of the Telugus from Madras State consequent on the Reorganisation of States. Kannada has recorded a fall from 301 to 253. A part of the Kannadiga people had their headquarters in Madras. The role played by South Canara in the History of Madras is more significant than their numbers would warrant. The people of South Canara district had a preferential attachment to Madras rather than to any Kannada speaking areas. The Linguistic Reorganisation of the States by which South Canara was merged in Mysore State has cut off the contact with Madras completely with the result that the Kannada speaking people have recorded an appreciable fall in their proportion from 301 to 253. Again Tulu as a language of Madras State has disappeared. Malayalam has shown an increase, i. e. 118 to 121. Actually, the States [Reorganisation should have affected the percentage of Malayalees also adversely because with the disappearance of Malabar district from Madras State, the affinity of the Malayalees to migrate to Madras should have disappeared. But there is reason to believe that though Madras has ceased to be the legal and administrative headquarters of a large section of Malayalees residing in Kerala, it continues to be the centre of attraction for work of a particular nature. The influx of Malayalees continues to be as steady as ever and this trend cannot be reversed so long as there is acute unemployment in Kerala State and the long association of Malabar with Madras cannot disappear. Actually, even before the formation of the Linguistic States, the Malayalam speaking people of Cochin and Travancore had direct interest in Madras State and instances cannot be wanting where the people of those States have returned themselves as citizens of British India to get appointment in Government service. A large number of Doctors and Engineers belong to the old Travancore-Cochin State and they are found in different parts of Madras State in some capacity or other. As long as the draw of Madras State for a Malayalam speaking person is one of employment, not necessarily in Government service, the influx of

Malayalees will continue to be as strong as ever. In Madras no limitation is imposed on employment of Malayalees in any sector and as such, their absorption though difficult in Government service is quite easy in the private sector. The industrial development of Coimbatore, Madurai and Madras City has also drawn a large number of Malayalam speaking people to the private sector.

Another striking feature of the Table is the complete disappearance of Hindustani people and fall in the number of Hindi speaking people. In 1951, 22 persons out of 10,000 spoke Hindi and 23 persons spoke Hindustani. In 1961, it has been returned as 12 for Hindi and it is negligible for Hindustani. At the same time, Urdu speaking people have increased from 142 to 183. If Hindustani, Hindi and Urdu are treated as one language, it will mean that their percentage has remained stationary. This peculiar phenomenon is due to the fact that in 1951 some of the Urdu speaking people have returned themselves as speaking Hindustani. Perhaps the Muslims of Madras State in their desire to conceal their identity in 1951 have chosen the less harmful term 'Hindustani'. Some of them should have also chosen Hindi wherever necessary because Hindi speakers have fallen from 22 in 1951 to 12 in 1961. Actually, from the migration statistics we find that there is a larger influx of North Indians to Madras State during this decade. Persons belonging to the Hindi speaking areas have moved in larger numbers and as such, the number of Hindi speaking people should record a rise. The remarkable feature observed is the drop in the number of Marathis from 19 to 15. No rational explanation can be given for this fall. There is no compelling linguistic force which should send them out of Madras State. They are generally found concentrated in Madras, Thanjavur and Salem. A remarkable decrease is noted in Nilgiri. The result of the changes which we have discussed is to improve the basic content of the population, viz. Tamils from 8,195 to 8,315 in Madras State. This increase cannot be attributed to migration because Madras is a net Migration State and as we have seen in the Chapter on Migration, Madras has lost more persons than it has gained. Actually more Tamils have gone out of Madras State than non-Tamilians who have come in. This result should

therefore, be attributed to the impact of the linguistic reorganisation under which Madras ceased to be the headquarters of Telugu speaking, Malayalam speaking and to a lesser extent the Kannada speaking people of South India. No more do the Kannadigas, Telugus or Malayalees look to Madras as their economic, legal, administrative and educational capital. Many universities have grown up in South India. Madras University in spite of its high tradition today has only the colleges in Madras State under its control. The trend of the decade has, therefore, been that in spite of the best wishes of the administrators of Madras State, the State has become more Tamilian in its structure. This tendency will continue because other areas which are less developed than the Madras State are doing their best to advance not only industrially, but also educationally and in all other fields of activities. There is a proportionate increase in the number of North Indian influence in Madras State. But in the overall linguistic composition, such migration cannot have any effect. The increase of Tamilians as will be seen by the figures of 1961 is the lowest in the whole of India.

#### Language proportions in 1951 and 1961

18. I have prepared a Table (Table-15) by which we can study the impact of Linguistic Reorganisation on the language composition of Madras State. Ten important languages have been listed. For this State, only 8 districts have been selected. These districts are either unaffected or least affected by the Linguistic Reorganisation and will therefore give us comparative figures without any mathematical adjustment, which has become a regular feature of the analysis of data in 1961 census. Such adjustments, however sound they be, do not always give us a correct picture of what is happening. It will be seen that the percentage of Telugu speaking people have recorded a uniform decrease in all the districts except in Salem which has recorded a small increase. This decrease is not found in Madras City alone. It is found in Madurai, South Arcot and Tiruchirappalli to a large extent and in Nilgiri, Thanjavur and Ramanathapuram to a larger extent. We have not compared the figures of Chingleput district since on the basis of Pataskar Award, an inter-change of Telugu and Tamil population

has taken place between Andhra Pradesh and Madras State. Salem which is contiguous to Andhra Pradesh still continues to have the same percentage of Telugu speaking people. There is one difference between Salem and other districts of Madras State. In other districts, Telugus are economically in a much better position than in Salem where they are generally agriculturists and handloom workers. Perhaps, Linguistic Reorganisation cannot affect the fortunes of the poorer sections as much as the better sections. The result is that the Andhra has found it more profitable to return to his home State and seek his fortunes. It is to some extent a natural process. Telugus have played a very important role in the development of the State itself. When a new State was formed, his interest naturally centred round that new State and influx of population took place. Actually, the Madras State do not represent the most fertile and economically rich area of Southern Peninsula. As such, migration towards the North consequent on political changes is a necessary step which cannot be avoided.

As regards Kannada, a similar fall is recorded except in Salem district which is contiguous to the Mysore State. The fall is more pronounced in Nilgiri, Tiruchirappalli and less in Madras City and Madurai. The trend is significant with the formation of Mysore State. There is a tendency for Kannadigas to move towards Mysore. One of the factors which has accelerated this movement is the development of Bangalore as an important industrial centre and the educational facilities which are found in Mysore State to-day. Two decades ago, Mysoreans depended on Madras for their higher education, both professional and general. But that era has passed.

Malayalam speaking people, in contrast to what is to be expected, have recorded an increase in Madras City and Nilgiri. A similar increase will perhaps be recorded in Coimbatore also. The proportions in other districts more or less remain unchanged with no tendency for the percentage to drop appreciably. Though the reasons given above apply to the Malayalam speaking people also, as indicated already, they have continued to migrate to Madras in search of employment and this is reflected by the fact that Kerala has contributed a large number of migrant population with a male

majority of more than 40,000. The migration from other States is based on factors different from that of Kerala. Keralites come in search of employment and they accept whatever employment they can get. The only conclusion we can draw is that but for the States Reorganisation Act, they would have been found in much larger numbers in Madras State. The result of the Linguistic Reorganisation as far as Tamils are concerned is an increase in Madras, Madurai, Tiruchirapalli and Ramanathapuram to an appreciable extent. In Salem, a slight fall has been recorded. Salem has recorded a migration of 5,927 males and 12,576 females from Mysore State. It means that culturally Salem continues to be part of Mysore

Plateau and as such, the tendency for the people of Salem to marry in Mysore continues. This has resulted in an increase in the proportion of the Kannadigas in Salem. It is also likely that the development of handloom industry in Salem district may have acted as a centrifugal force in attracting weaving communities of Andhra and Mysore origin. The result is that in this district the percentage of Kannada speaking and Telugu speaking people has increased with a fall in the number of Tamil speaking people. Being a very backward district of Madras State, Salem does not have the capacity to attract any Tamilians from other districts as migrants.

	U	10,000	...	...	...	...	9,497	...	...
Kanyakumari	R	10,000	...	...	1,335	...	8,646	...	...
	U	10,000	...	...	838	...	8,757	...	...

Note : Languages spoken by more than 5% of the population of each district for rural and urban areas separately has been taken as Major languages for each district rural and urban area.

The significant features are the prevalence of Urdu as a major language in Madras, in urban areas of North Arcot, Salem and Tiruchirapalli district. Telugu is found as major language throughout the State except in the rural parts of South Arcot, in the districts of Thanjavur and Kanyakumari and in urban parts of Tirunelveli. Malayalam is a major language in the urban parts of Coimbatore and in Nilgiri and Kanyakumari districts. Kannada is a major language in the districts of Salem, Coimbatore and Nilgiri and

in rural parts of Madurai. The language closely identical to Kannada is Badaga which is a major language in the Nilgiri district. This shows the pattern of distribution in the State which has been discussed in detail earlier.

#### Tribal Languages

20. Below we give a comparative statement of numerical strength in the Census of 1961 of certain tribes and the number of persons who returned mother-tongue that go by these tribal names.

TABLE X — 17 (Contd.)

*A comparative statement of (a) numerical strength in the Census of 1961 of certain Tribes and of (b) the number of persons returned speaking as mother tongue the languages that go by those tribal names*

Scheduled tribes and mother-tongue (in alphabetical order)		Salem		Coimbatore		Nilgiri		Madurai		Tiruchi apalli		Language
		Males	Females	Males	Females	Males	Females	Males	Females	Males	Females	
(1) Irular	(a)	12	13	14	15	16	17	18	19	20	21	
	(b)	2,416	2,225	5,396	5,202	2,327	2,175	3	5	1,085	1,069	
Irula	(a)	10	8	46	38	1,992	1,966	...	...	...	...	
(2) Kattu Naicken	(a)	84	74	12	8	299	313	283	257	55	99	
Kattu Naicken	(b)	...	...	...	...	...	1	...	...	...	...	
(3) Kota	(a)	...	...	...	...	460	372	1	...	...	...	
Kota	(b)	...	...	...	...	467	395	...	...	...	...	
(4) Paniyan	(a)	...	...	...	...	2,468	2,309	1	...	...	...	
Pania	(b)	...	...	...	...	2,590	2,549	...	...	...	...	
(5) Solaga	(a)	31	37	3,009	2,941	66	51	1	..	...	...	
Solaga	(b)	...	..	972	959	..	...	...	...	...	...	
(6) Toda	(a)	...	...	1	...	370	336	2	1	...	...	
Toda	(b)	...	...	...	...	384	375	...	...	...	...	

The speeches are of special interest. Irula language is spoken only by 4,095 out of 79,835 Irula population. Irula language is spoken chiefly by Irulas living in Nilgiri and parts of Coimbatore. It is a dialect of Tamil which has retained the characteristics of old Tamil to a much greater extent than any other dialect with the result that it is to-day spoken only by those Irulas who live in inaccessible places, parts cut off geographically from Tamil speaking people. That is why a large number of Irula speakers are found in Nilgiri hills. Wherever Irulas have come into contact with Tamil speaking people, they have either lost the peculiarity of the language which characterised it or they have identified their languages and returned it as Tamil. The latter is more probable. The fact that a few speakers are found in the return from different districts of the State shows that Irula language as a separate language is understood by the people. They come into contact with the people who speak correct Tamil and because of the fact that their medium of instruction is Tamil language, their mother tongue has been returned as Irula language. A discussion on Irula language will be found in our volume on Languages of Madras State. Some problem is found among the Kattunayakans whose language has been identified as Naiki. They have now been returned as Tamil speaking except in the district of Nilgiri where certain peculiarities are still retained and that language is distinct from that of Tamil by its separate name. The Kota language is a distinct one and is returned by all persons speaking that language. Paniyans have returned their language as Paniya in Nilgiri district. One in Madurai and one in Tirunelveli have been returned as Paniyan.

Sholaga is returned only by about 1/3 of the Solagas from the Coimbatore district. Solagas are found in smaller numbers in Salem and Nilgiri. But they have returned Tamil as their language. The majority of the Solagas in Coimbatore district have also returned Kannada as their language. The manner in which Solaga

can be distinct from Tamil and the close similarity between the two languages will be discussed in our volume on languages of Madras.

Only Todas in Nilgiri district have returned Toda as their language. The variation between the figures of Todas and Toda language speakers is only 46. All other tribes in Madras State speak only a form of Tamil; the tribes on the borders of Kanyakumari in Madras State and the tribes who are seen on either sides of the western ghat speak a mixture of languages, an impure form of Tamil and Malayalam which can be understood only with difficulty. In this class will fall Kanis, Kadars and Muduvans. A group scrutiny will, however, reveal that their languages have features reminiscent of ancient Tamil and represent a mixture of old Malayalam and modern Tamil.

### Bilingualists Among Tribal Population

21. It will be of interest to examine what languages are spoken by the tribes in Madras State and to what extent they have begun using subsidiary languages. Sometimes tribes who are found in different parts of the State have adopted the local language as mother-tongue. It would not be correct to say that any particular tribe has a particular language of its own except perhaps Kotas and Todas of Nilgiri. The peculiarity of the language is more the result of geographical isolation and whenever the tribes have come in contact with Tamil language, the tribal language has lost its peculiarity. Any special features in the dialectical structure of the language cannot be known through an inquiry during Census. That study has to be undertaken separately. But such dialectical variations can also be seen between the languages spoken by Tamilians in Tirunelveli, Thanjavur and Madras and also the language as spoken by Brahmins, Saivites, Chettiars, etc. They will form a subject of separate study.

Table below gives the distribution per 10,000 speakers of Mother tongues spoken by Scheduled Tribes in the State who also speak one or more subsidiary languages.

TABLE X — 18

*Distribution per 10,000 speakers of Mother tongues spoken by Scheduled Tribes in the State who also speak one or more Subsidiary languages, 1961*

(a) Denotes absolute figures for each sex returned in 1961

(b) Denotes the above as proportion of 10,000

### Classification of Certain Language Returns

22. The returns Sikhi and Gurumukhi which are the names of a religion and a script actually cover Punjabi language. Udaiyar and Valluvar castes have returned their mother-tongue as Udaiyarmoli and Valluvarmoli which represent a form of Tamil. The return Kuruvikkaran indicates the occupation of the caste. It has not been possible to classify it in any language family. An attachment to religion and caste is reflected in the language returns also.

Five speeches-Bithalanean, Roman, Satrali, Sigitvia and Vaipaki have been treated as unclassified. Later, linguist added one to this list—Kuruvikkaran. He has also merged Sikkari with Kuruvikkaran. These 7 unclassified speeches have been returned during 1961 Census spoken by 76 persons.

### Dravidian languages and their genetic affinities

23. The six cultivated speeches of Dravidian family are Tamil, Telugu, Kannada, Malayalam, Tulu and Kodagu. Other uncultivated speeches have shown a tendency to decrease. Dr. Caldwell enumerated six uncultivated Dravidian dialects — Toda, Kota, Gond, Khond or Ku, Oraon and Rajmahal. Apart from these, Badaga, Irula, Kurumba, Korava, Paniya, Solaga, Urali, Naika, Chettibhashai, Montadan Chetty and Kattunaicken have been returned as Dravidian speeches. A detailed field study of these dialects has been taken up separately by the Census Organization. We have added more uncultivated Dravidian dialects such as Kolami, Naiki, Parji, Gadaba, Ollari, Salur, Kuwi, Kurukh and Malto. These languages are spoken in pockets in other States of India. The existence of a Dravidian speech — Brahui in Baluchistan has been discovered years ago. In Afghanistan a dialect called Barzui, akin to Tamil is spoken. Prof. Burrow is now engaged in the study of a Dravidian speech called Pengu spoken in Orissa.

According to Dr. Caldwell "Dravidian languages occupy a position of their own between the languages of the Indo-European family and those of the Turanian or Scythian group, not quite a midway position but one considerably nearer the latter than the former". Dr. Konow, the author of Fourth Volume of Linguistic Survey of India has not accepted the view that Dravidian languages are linked with Scythian. Dr. N. Lahovary,

the French Scholar has observed that the Dravidian languages are members of an ancient pre-Semitic polysynthetic linguistic family which covered most of India and the Middle or Near-East. Before the Indo-Aryan invasion North Mesopotamia and Syria were the breeding grounds of the people speaking this type of language. He has made laborious attempts to prove the genetic affinity between the Dravidian languages and Basque which still survives in Pyrenees on the border land between France and Spain. To him the Western Dravidian (Kannadam, Toda, etc.), due to its phonetic systems (initial or medium b or p, final a) when compared with Eastern Dravidian (Tamil and Malayalam) (P or V final etc.) is the closest to Basque or kindred languages of Southern Europe whereas the Central Dravidian Kui and Kurukh shows more affinities with the Semitic Vocabulary while Tulu and Telugu seem nearer to Western Dravidian than to Eastern Dravidian. He has argued that just as the Indo-Aryan languages of Northern India are related to the Indo-European languages of North Eastern Europe, the Dravidian languages of South India are more or less closely related to a near Eastern and Mediterranean Agglutinative group of languages of Pre-Indo-European times. This view presupposes that the territories around the Mediterranean and the regions in the Middle and Near-East were dominated by the Dravidian languages. However, this theory has been now disproved by Prof. Burrow.

In addition to the Dravidian languages spoken in Madras State, two Indo-Aryan speeches — Saurashtra and Lambadi have been taken up for special studies. The result will be published in a separate volume titled as "Languages of Madras State".

### Tulu

24. Tulu has been returned from all districts by 4,672 persons. The number has increased during 1951-61, the figure in 1951 being 2,512. The newly formed Kanyakumari district has returned 437 persons. Dr. Caldwell classified this as a cultivated speech and ranked it with other principal Dravidian languages. It has no script of its own. It is now written in Kannada script. According to the Tamil Encyclopedia, Tulu possesses a sound and rich vocabulary capable of expressing most abstract ideas. During 19th

century Tulu was written in Malayalam script and the Basel Mission Press introduced Kannadam script in 1842. The expression Tuli denotes 'braveness' which may have its etymological affinity with Tulu. Dr. Caldwell has the following comment on this language. "Notwithstanding its want of literature, Tulu is one of the most highly developed languages of the Dravidian family. The name Tulu means, according to Mr. Brigel, mild, meek, humble and is to be regarded therefore as properly denoting the people, not their language. Tulu was treated by Mr. Ellis as a dialect of Malayalam. Although Malayalam characters were and still are ordinarily employed by Tulu Brahmins in writing Sanskrit, the presumption that Tulu was a dialect of Malayalam can no longer be sustained. The publication of Mr. Brigel's Tulu Grammar has thrown new light on this interesting language. Tulu differs far more widely from Malayalam than Malayalam does from Tamil. It differs widely, but not so widely from Canarese, still less so from Coorgi. The dialect from which it differs most widely is Tamil".

The authors of Dravidian Comparative Vocabulary published by the University of Madras have included Tulu among other principal Dravidian languages.

#### Coorgi or Kodagu

25. Coorgi or Kodagu has been returned by 627 persons as against 526 in 1951. No Kodagu speaking person has been returned from Kanyakumari district. "The native spelling of Coorg" Dr. Caldwell says, is usually Kodagu, properly Kodagu from Kuda, West, a meaning of which is usual in ancient Tamil." He considers that this language "has generally been considered rather as an uncultivated dialect of Canarese, modified by Tulu than as a distinct language", though he feels that the point to which of the Dravidian dialects the language is closely allied remains to be studied. The language occupies a midway position between old Kannada and Tulu. On the other hand, Mr. Sten Konow, the author of the fourth volume of the Linguistic Survey of India feels that Kodagu must be classified as lying between Tamil and Kannada. Kodagu has no script.

#### Toda

26. Toda, properly Tuda, has been returned by

760 persons of which only one female belongs to Madras City and the others to Nilgiri. The figures shown below give the numerical strength of Toda language from 1891 to 1961.

1891	...	736
1901	...	805
1911	...	730
1921	...	663
1931	...	597
1951	...	879
1961	...	760

*Note.* In working out the above figures the figures recorded in the respective Censuses for districts now in the present Madras State have alone been taken into account and excludes Kanyakumari for which details are not available.

In fact in 1911 a doubt was expressed that the language Toda will assuredly come to an end with the disappearance of the Todas. But fortunately neither Todas nor the language has failed to survive. Toda has no script. It was observed during the enumeration in 1901 that some of the Todas were then taking to speaking Tamil. In his 1911 Census Report of Madras, Mr. Chartres Molony says that "The language of this people (Todas) is interesting because it is incomprehensible to one unacquainted with its sound not unlike the speech of the halfaloes, a fact which may explain the sympathy between the Toda and his herd. Practically all Todas can speak Tamil or the dialect of Canarese current on the Nilgiri." It is said that no stranger has ever learned this language sufficiently to converse in it without the supplement of Tamil or Canarese words. The Nilgiris District Manual makes the following observation on Toda speech: "The Toda language is by no means peculiar to themselves as was once thought. It is a dialect of old Canarese and closely allied to other Dravidian dialect and some of these are peculiar to it, seeming to have been modified by the position and habits of the people. On the structure of the language, he says that Toda is a language which was once highly inflectional, but having lost most of its inflections, the people who have evidently degenerated in every way as the result of isolation have not replaced

them by significant principles or auxiliaries to the same extent as the other South Indian tribes and the language has thus dwindled down to a mere skeleton".

"A few Tamil forms were introduced by the Poligars. Intercourse with the Badagas has probably modernised a few of the forms and introduced some words. Of Telugu influence I see no trace, nor can I trace any resemblance, in Toda to Malayalam in any of the points where the dialect differs from its sisters. The language seems to have been originally old Canarese and not a distinct dialect".

Captain Harkness who is quoted by T. W. Brecks in his *Primitive Tribes of Nilgiris* comments as follows: "It (Toda) appears to be quite distinct from the languages of the surrounding countries; with the Sanskrit it has not the least affinity in roots, construction or sound and I may venture to say so, as little with any Asiatic language of the present day.

Tamil and Canarese derivatives form the bulk of the language. Out of hundred words commonly made use of by a Toda, Mr. Metz finds eighty to be identically the same with or derived from words used by his Dravidian neighbours."

Dr. Caldwell is of the opinion that of all the Dravidian idioms Tamil is that to which the Toda language is most nearly allied. Grierson endorses this view.

Mr. Metz thinks that it is more nearly connected with old Canarese, but this is as distinct a dialect as Tulu.

Surprisingly Mr. Burnell noted the large proportion of Sanskrit words in the Toda vocabulary. On the other hand, in his Report on the Socio-economic conditions of the aboriginal tribes in the province of Madras, Dr. Aiyappan says that the language of the Todas is definitely connected with Tamil rather than with Kannada".

A detailed study of the Toda language has been made by the Census Organisation which has justified the view that Toda is more allied to the basic Tamil than any other South Indian language.

#### Kota

27. Kota has been returned by 862 persons in 1961. The speech Kobhashai returned by 94

persons from the Nilgiri district has also been merged with Kota thus raising the numerical strength to 956.

Mr. Thurston quoting Dr. Oppert says that the derivation of the Kota is from the Ganda-Dravidian word Ko (Ku) mountain and the Kotas belong to the Gandian branch.

Dr. Caldwell considers the language of the Kotas as a very old and rude dialect of the Canarese. Mr. Thurston has pointed out that the Kotas speak a mixture of Tamil and Canarese and speak Tamil without the foreign accent which is noticeable in the case of Badagas and Todas. Mr. H. B. Griggs in the *Manual of the Nilgiri district* concludes that Kota's pronunciation is mere dental. The number of speakers in Kota have recorded a gradual downfall as is seen from the figures shown below :

1891	...	1,201
1901	...	1,300
1911	...	1,271
1921	...	1,192
1931	...	1,123
1941	...	952
1951	...	Not available
1961	...	862

(See note under Toda)

According to the 1931 Census Report, the reason for such gradual decrease is that where primitive tribes come into contact with more civilised people, their language as a rule, weakens and disappears. Kota has no script

#### Korava or Kurava

28. Korava, properly Kurava, a dialect of Tamil has been returned under various denominations by 876 persons. The synonyms are : Korava (58), Korchi (57), Kurabhashai (399), Kurava (337) and Yerukula (25). In 1951 Census separate figures were not given for Korava. They were clubbed with Irula. A study of the numerical strength of the speakers of Korava dialect

shows that it has recorded a fall from 1891 to 1961.

1891	...	37,536
1901	...	2,949
1911	...	2,443
1921	...	576
1931	...	1,365
1941	....	NA
1951	...	NA
1961	...	876

(See note under Toda)

During our field study on this dialect at Muttampatti, Salem district, a number of Koravas were found serving in Government Departments, especially as Teachers. On enquiry we found that they preferred to return their mother-tongue as Tamil instead of Korava. This may be one probable reason for the decrease in their numerical strength.

#### Irula

2. Irula, a dialect of Tamil has been returned by 4,095 persons. The figures given below show the growth of the dialect from 1891 to 1961.

1891	...	1,582
1901	...	932
1911	...	2,358
1921	...	1,284
1931	...	1,481
1951	...	...
1961	...	4,095

(See note under Toda)

In 1951 this dialect was merged with Korava and Yerukula. Two other return — Kosavan (41) and Kaspar (8) have been treated as synonyms of Irula.

#### Solaga and Urali

30. Solaga, a dialect of Kannada has been returned by 1,931 persons in Coimbatore district. No detailed study of this dialect has been so far made in spite of its close affinity to Kannada. Similar is the case of Urali which occupies the midway position between Tamil and Kannada. The Urali dialect has been returned by 1,040 persons from Coimbatore district. A close study of these speeches tends to show them as sister dialects. These speeches have been taken up for a detailed study by Census Organisation.

#### Badaga

31. Badaga has a numerical strength of 85,371 persons. The dialect has recorded a steady and remarkable growth from 1891 to 1961.

1891	...	30,654
1901	...	34,229
1911	...	38,688
1921	...	39,751
1931	...	42,521
1951	...	67,285
1961	...	85,371

(See note under Toda)

The Badaga dialect which has no script is a corrupt form of Canarese. According to the Nilgiri District Manual, it is a dialect of old Canarese. No comment can be found in the previous Census Reports. Grierson considers that the dialect is a more ancient form than ordinary Canarese and in several points it agrees with the old literature.

#### Kurumba and Naika

32. Kurumba, a dialect of Canarese has been returned by 2,666 persons. The speakers are concentrated chiefly in Nilgiri district. The numerical strength of this dialect has tended to fall.

1891	...	3,742
1901	...	3,982
1911	...	3,005
1921	...	2,946
1931	...	Not available
1951	...	do
1961	...	2,666

(See note under Toda)

The speech Naika, according to Linguist, spoken in the Nilgiri district with a strength of 1,167 persons has been merged with Kurumba.

#### Koraga

33. Till now Koraga which has been returned by 14 persons from Salem district was treated as a dialect of Tulu. This view has been questioned recently. Dr. Aiyappan feels that the name Koraga may be a corruption of Kuravar or hill-men. The authors of Dravidian Comparative

Vocabulary have expressed the view that the expression Koraga is nothing but a Tulu equivalent of Tamil Kurava and Koragatti is a Tulu equivalent of Tamil Kuratti (female of Korava caste). The etymological definition furnished by the authors of Dravidian Etymological Dictionary also confirms the view that Koraga is a Tulu expression to denote Tamil Korava. Mr. A. A. D. Luiz in his 'Tribes of Kerala' has stated that there is a possibility that their name is a corruption of Koravar which in Tulu means the people of the hills. In the absence of a detailed study, it is not possible at this stage to merge Korava and Koraga. Till more information is collected on its vocabulary, construction of syntax, parts of speech etc., we may accept Mr. H. A. Stuart's view in treating the speech as an independent one. In this connexion the views expressed in 1891 Census Report of Madras are relevant: "in their intercourse with other people they speak Tulu, but it is believed they speak a separate language at home quite unconnected with any other main language. Though the language appears to have affinity to the other Dravidian languages, especially Tulu, yet it is not greater than what exists between Tulu, and Canarese or between Malayalam and Tamil. It would, therefore, seem to be more correct to show the language as an independent Dravidian language than as a dialect to Tulu or other language".

According to the 1911 Census Report of Madras, Koraga is the Tulu of a depressed class in South Kanara. Grierson is of the view that Koraga is a dialect of Tulu. Somewhat surprisingly the 1931 Census Report of Madras State states that it may be that Telugu can claim indigenous representation even on the West Coast by the tribal speech of the Koragas of South Kanara. This tribe has private jargon in which it communicates among themselves and not to outsiders. It is said to resemble Telugu. According to Mr. A. A. D. Luiz, they speak a corrupt Tulu which is difficult to understand. Even those with knowledge of Tulu need the assistance of an interpreter.

#### **Paniya**

34. Paniya has been returned by 5,139 persons from Nilgiri district. It has close linguistic affinity with Malayalam. No comment

can be found in previous Census Reports. According to Thurston, Paniya language is a debased Malayalam spoken in a curious nasal sing-song difficult to imitate. Mr. A. A. D. Luiz is of the view that Paniyas among themselves speak a very corrupt dialect of Malayalam with an admixture of Tamil and Tulu words and phrases which is difficult to understand. As a result of our ethnographic study of this tribe, we are of the view that they speak a corrupt form of Malayalam. They call their language Paniya-bhasha which is a mixture of many languages. It has no alphabet. In the same group, six types of dialects are found.

#### **Montadanchetti**

35. Montadanchetti has been returned by 1,650 persons from Nilgiri district. According to the Gazetteer of the Nilgiri district, Montadanchettis speak a corrupt Canarese and Montadan is supposed to be a corruption of Mahavalinadu, the traditional name still applied to the country between Nellakottai and Tippukadu in which these Chettis principally reside. Though it is said that they speak corrupt Canarese, none has returned Kannada as their subsidiary language. The speech Mountain with a strength of 40 persons returned from the Nilgiri district has been merged with Montadanchetti raising the numerical strength to 1,690.

#### **Chettibashai**

36. Chettibashai has been returned by 711 persons from Nilgiri district. The Linguist has grouped it under Kannada, but it needs further study to classify it either under Malayalam or Kannada. Actually, 185 speakers of Chettibashai speak Malayalam as their subsidiary language and 63 speakers speak Tamil.

#### **Kattunaicken**

37. Kattunaicken has been returned by one person from Nilgiri district. Mr. A. A. D. Luiz says that their (Kattunaickens') dialect consists of words and phrases drawn from all the Dravidian Languages.

#### **Saurashtra**

38. Saurashtra, an Indo-Aryan speech spoken only in the South has been returned by 155,392

persons in Madras State. The other synonym of Saurashtra is Khatri which has been returned by 332 persons from Madras and Chingleput district. Saurashtra is spoken throughout the State but its speakers are concentrated in Madurai. Dr. H. N. Randle the former Librarian of India House, London and an Indologist has made the following observations on this language: "The Saurashtri language also called Patnuli or Khatri has been classed as a dialect of Gujarati. It certainly appears to belong to the Gujarati-Rajasthani linguistic type; but although it has some forms such as a causative in-d-and passive in-a-which connect it specifically with Gujarati, its inflections are not those of Gujarati, and its basic vocabulary is predominantly Marathi. For these reasons it is not possible to regard it as a dialect of Gujarati. It has come under Dravidian influence. Some writers, but not all, use a considerable number of Dravidian words and admit a Dravidian noun base-am (u) and Telugu plural in-lu. But the Dravidian influence has made itself felt very much more in certain aspects of syntax and idioms than in vocabulary and morphology. Nevertheless, although the infiltration of Dravidian syntax is a deep influence which cannot be escaped even by an author like T. M. Rama Rai who scrupulously avoids Dravidian words and does not use the Dravidian noun base in a-m-u, it remains true that Saurashtran is through an Indo-Aryan language. Saurashtran publications are sufficient proof that it is an adequate medium for literary expression".

The Saurashtra Prachara Sabha, an organisation founded in Madurai with a view to develop the Saurashtra language and literature is of the view that the language spoken by Saurashtras of South India is a modified form of Sauraseni Apabhramasa. According to them the Sauraseni Apabhramasa which has taken the shape of Hindi in the North has remained as Saurashtram in South with its Dravidian influence. The student of Hindi or Hindustani who can read and understand the other Apabhramasas of North like Maithili, Rajasthani, Brijhasha and Avadhi does not find it easy to read and understand Saurashtran of the South. The following are the reasons for this:-

(i) The usage of a script—Saurashtra

Puratana Lipi which is entirely different from Devanagari or other scripts of Indian Languages and

(ii) the Dravidian influence that has been acquired by the Saurashtram.

The important characteristics of the Saurashtran alphabetical system is the possession of short e and o contrary to other Indo-Aryan languages. This can be explained by the influence of Dravidian languages. Besides, some aspirated composite sounds like nha, mha, rha and iha are found among consonants. These forms which are found only in Saurashtra are called Haru characters, which are unknown to other Indo-Aryan languages. It has 12 vowels as noted in Tamil and the remaining 6 vowels—ru, ru, lu, lu, am, and ah are borrowed from Sanskrit. It has no extensive literature in spite of its antiquity. According to Prof. Easwarlal Ratilal Dave, the work of the first available Saurashtran work entitled Puratana Saurashtra Lipi Arichchuvadi was written in Saurashtra script in 1750 A.D. Actually, the early literature can be traced only from the 19th century. The first works were only school books in Saurashtra Puratana Lipi. Till the emergence of the Saurashtran poet Venkata Suri (1818-1890) who was the Asthana Kavi (Court Poet) of King Sarfoji of Thanjavur, no lyrical or classical work was produced in the Saurashtra language. His work entitled Samgita Ramayana containing 534 slokas and 347 kirtanas has been classified as a monumental work. It has been published in Telugu and Tamil scripts.

In 1951 Census Report, an observation has been made that Saurashtra has no script of its own. The Saurashtrians have reacted sharply to this comment. I reproduce below the communication addressed by them to me :-

"The Nagari letters which are the unique letters of Sanskrit as well as Saurashtran suit much for written form and as early as 1926 the 5th Conference of Saurashtras decided to adopt Nagari (Hindi) Letters for written form and since then attempts are being made to give effect to this decision."

It is a fact that a number of books are being printed and published in Nagari script as well as Saurashtran script. As the common Saurashtran does not know Nagari or Saurashtran script, Tamil script is employed in their education and

daily life. The lyrical work "Samgita Ramayana" has also been printed in Telugu script. Thus the Saurashtra language is written in four different scripts—Tamil, Telugu, Nagari and Saurashtra. In spite of the best efforts of the Saurashtrians, it is not possible to popularise the Saurashtran script which has been accepted as an emblem of their honour at present.

### **Lambadi**

39. Lambadi which is a gypsy language has been returned by 3,273 persons from the districts of Salem and Coimbatore. 1901 Census has treated this speech as a gypsy language. The language 'Lambadi' is usually based on one of the local vernaculars and embodied and diversified

with thieves' slang and expressions borrowed from various localities in which a tribe has been sojourned. Cust thought that Lambadi was semi-dravidian, but the point is not clear and it has been classed as Indo-Aryan.

According to 1951 Census Report of Madras, Lambadies speak their own language among themselves, but speak the regional language while conversing with others.

### **Conclusion**

40. I have attempted to give a general idea of the languages spoken in Madras State. More details will be found in the volume on languages of Madras State which will be published by the Census Organisation in due course.

## CHAPTER — XI

### RELIGION

#### Census Returns on Religions

Indian Census has devoted much attention to religion, caste and sect. Much has been written on religion and caste by previous Superintendents of Census Operations. It will no doubt be useful to a student of Sociology. Caste has not been recognised as a vital characteristic of the people in 1961 Census. All that has been attempted is to collect detailed information about Scheduled Castes and Scheduled Tribes. In fact, religion cannot be divorced from sect or caste in Madras State. Not only the Hindus, but also the Christians and Muslims observe caste in one form or other. The reason for this is perhaps that the religion in South India is of exotic origin. Even among the Muslims, we find a large number of Tamil-speaking Muslims who are indigenous to the soil in Madras State. Similarly, Christianity has never attempted to destroy the caste system as was found in South India. More so, Roman Catholic religion does not destroy anything it finds but consolidates it by imparting the ideas of one Church and one God. Thus, we can see the unusual spectacle of the Christians of Madras State observing those caste distinctions which formed the essential feature of the Hindu religion. Again, Hinduism in Madras is in its older form. It has not, like North India, suffered from foreign invasion or the direct impact of a more virile religion like Islam. As such, Hinduism is more a way of life than a creed in South India. To attempt a study of religions without a reference to caste is, therefore, difficult.

I have, in my Part V Report, indicated the origin of the castes. One remarkable feature which is observed in dealing with different faiths of Hinduism is that even the highest Brahmins and the lowest Paraya are willing to return themselves under the broad category called Hindus though they will not inter-dine or inter marry. This tendency has been more pronounced after Independence when a Hindu has a pride of his own. What is left to be done by missionary

activities in South India today is the concern of the Government and the phenomenal development in education which has taken place after Independence has deprived the temptation of the intellectual to become a convert to Christianity. Such instances can be found in cities like Tiruchirappalli and perhaps it is education which has attracted the highest classes of Hindus to Christianity.

#### Data on Religions Collected in the Censuses of 1871-1951

2. At this stage, it may be of interest to examine the development of data on religion in the Census history. In 1871, the strength of Hindus and Muslims was ascertained, others being classified separately. Information about caste or sect was also collected. In the second Census conducted in 1881, particulars of all religious groups were shown separately and data on caste in the case of Hindus and the sect in the case of other religious groups were also collected. In 1891, more information was collected on tribes in the forests and hills whose religious affiliation could not be defined and they were classified under 'Aboriginals'. Information on the racial origin of those other than the Hindus, Jains and tribes were also collected in addition to the Castes of Hindus and Jains. In 1901, the Census Schedule dealt with religions and castes in the case of Hindus and Jains, and tribes or race in the case of others. The name of the tribe or caste was collected in place of the classification of 'Aboriginals.' The census questionnaire of 1911 and 1921 followed the pattern of 1901. A slight modification was made in the questionnaire of 1931. The sects and subdivisions of all religions were recorded in 1931 and other questions on castes, tribes and races were identical with the previous censuses. In 1941, sub-sect of the religion was eliminated but questions on race, tribe and caste were retained. Perhaps, the attempt to collect as much information as possible on caste and religion was to a

large extent political because the then Government was interested in dividing the country into different groups. At the same time the persons concerned were also interested in the detailed study of the castes and tribes for anthropological and sociological purposes and that is why Census literature is extremely rich in material relating to caste. By 1951, the question on caste or race of the people was given up as a matter of general policy. But information was still collected on special communities like Anglo-Indians, Backward Classes and Scheduled Castes and Scheduled Tribes. In Madras State, Backward Classes cover a large number of castes among the Hindus.

Another basic change was made in 1951. Till 1941, tabulation was made on the basis of religion. In 1951, economic classification of livelihood classes was made the basis for tabulation in Census. In 1961 also the economic classification has been made the basis. It is unlikely that Indian Census will ever adopt religion as the basis of classification in future. As such, any study based on caste cannot be undertaken in Census Reports in future.

### 1961 Census Question on Religion

3. Religion was covered by Question 5 (b) in the Individual Slip. The relevant instructions issued during enumeration are reproduced below :

Religion — “5 (b) : This will have to be recorded under the various abbreviations as shown below :

H	—	Hindus
M	—	Muslims
C	—	Christians
J	—	Jains
S	—	Sikhs
B	—	Buddhists

These are some of the major religions professed by the majority of persons living in the State. There may, however, be persons who belong to religious classes like Brahma Samaj, Arya Samaj, etc. or there may be others who consider themselves as atheists. In such cases the answers given by them should be recorded in full”.

### Difficulties encountered in the Census Enumeration

4. Normally no difficulty should be felt in

enumerating religion which is a personal conviction of the person enumerated. The difficulty was to see that it conformed to the accepted religions like Hinduism, Islam, Christianity, Jainism, Sikhism and Buddhism. Even such denominations as Brahma Samaj, Arya Samaj and atheism were permitted. But one peculiar difficulty arose in Madras State, viz. that a section of people wished to call themselves Dravidians. ‘Dravidian’ cannot be accepted as a religious sect. It took a rather difficult turn in Coimbatore City where the municipality wanted the term ‘Dravidian’ to be adopted for Census enumeration and the Commissioner could not agree to it. In practice, the system followed was that wherever the enumerated person insisted on being returned as Dravidian it was done so with the proviso that the Enumerator noted “Hindu” against his name. In practice, any person who returned himself as Dravidian was treated as a Hindu in the Tabulation Office.

### Relegation of Religious Classification in the last two Censuses

5. Till 1951 Census, Census data were classified on the basis of religion. In 1951, however, economic classification was adopted which has been continued in this Census also. As such, religion has no particular significance in our classification. It has to some extent destroyed the comparability with the data available from previous Censuses. Still, religion is a basic and fundamental attribute of men and as such, a study of religion is of great significance to the sociologist. Further India has become a secular State. As such, no data relating to caste have been collected in 1961 Census except on that section forming the Scheduled Castes and Scheduled Tribes.

### Absence of religious problems in the present Madras State

6. Madras had no religious problem in the sense in which North Indian States had. In the composite State of Madras, a part of Malabar was the only area in which a concentration of Muslims was found, creating problems of law and order and administration. The Moplah rebellions are well known. Perhaps, it was consistent with the policy of the British to divide and rule the country that

much importance was given to the religious differences and in a sense the Census has encouraged this division by adopting religion with its sects and castes as the basis for presentation of tables.

**Distribution of religious groups in Madras**

7. Throughout its history, Madras had a majority of Hindus. In 1951, the composite State of Madras had 87.69% of Hindus. Two other important religious communities were Muslims with 7.96% and Christians with 4.26%. All other religions do not have any significant numbers in Madras State. As a consequence of the reorganisation of States which took place between 1951 and 1961, the religious composition of Madras

State has improved in favour of Hindus in that they form 89.94% of the population. The Christians form 5.23% which no doubt is due to the accretion of a large number of Christians by the addition of Kanyakumari District to Madras State. The percentage of Muslims has fallen from 7.96% in 1951 to 4.63% in 1961. The reason for this is the loss of about 15 lakhs of Muslims of Malabar consequent on the reorganisation of the States. The result of these changes has been that the Hindus form a larger majority with Christianity becoming the second religion in the State. Muslims have been relegated to the third rank. In table C-VII is presented the distribution of the population by religion. The percentage distribution is indicated in the table below:

TABLE XI — I

*Percentage distribution of population by religions, 1961*

‘N’ denotes negligible figures.

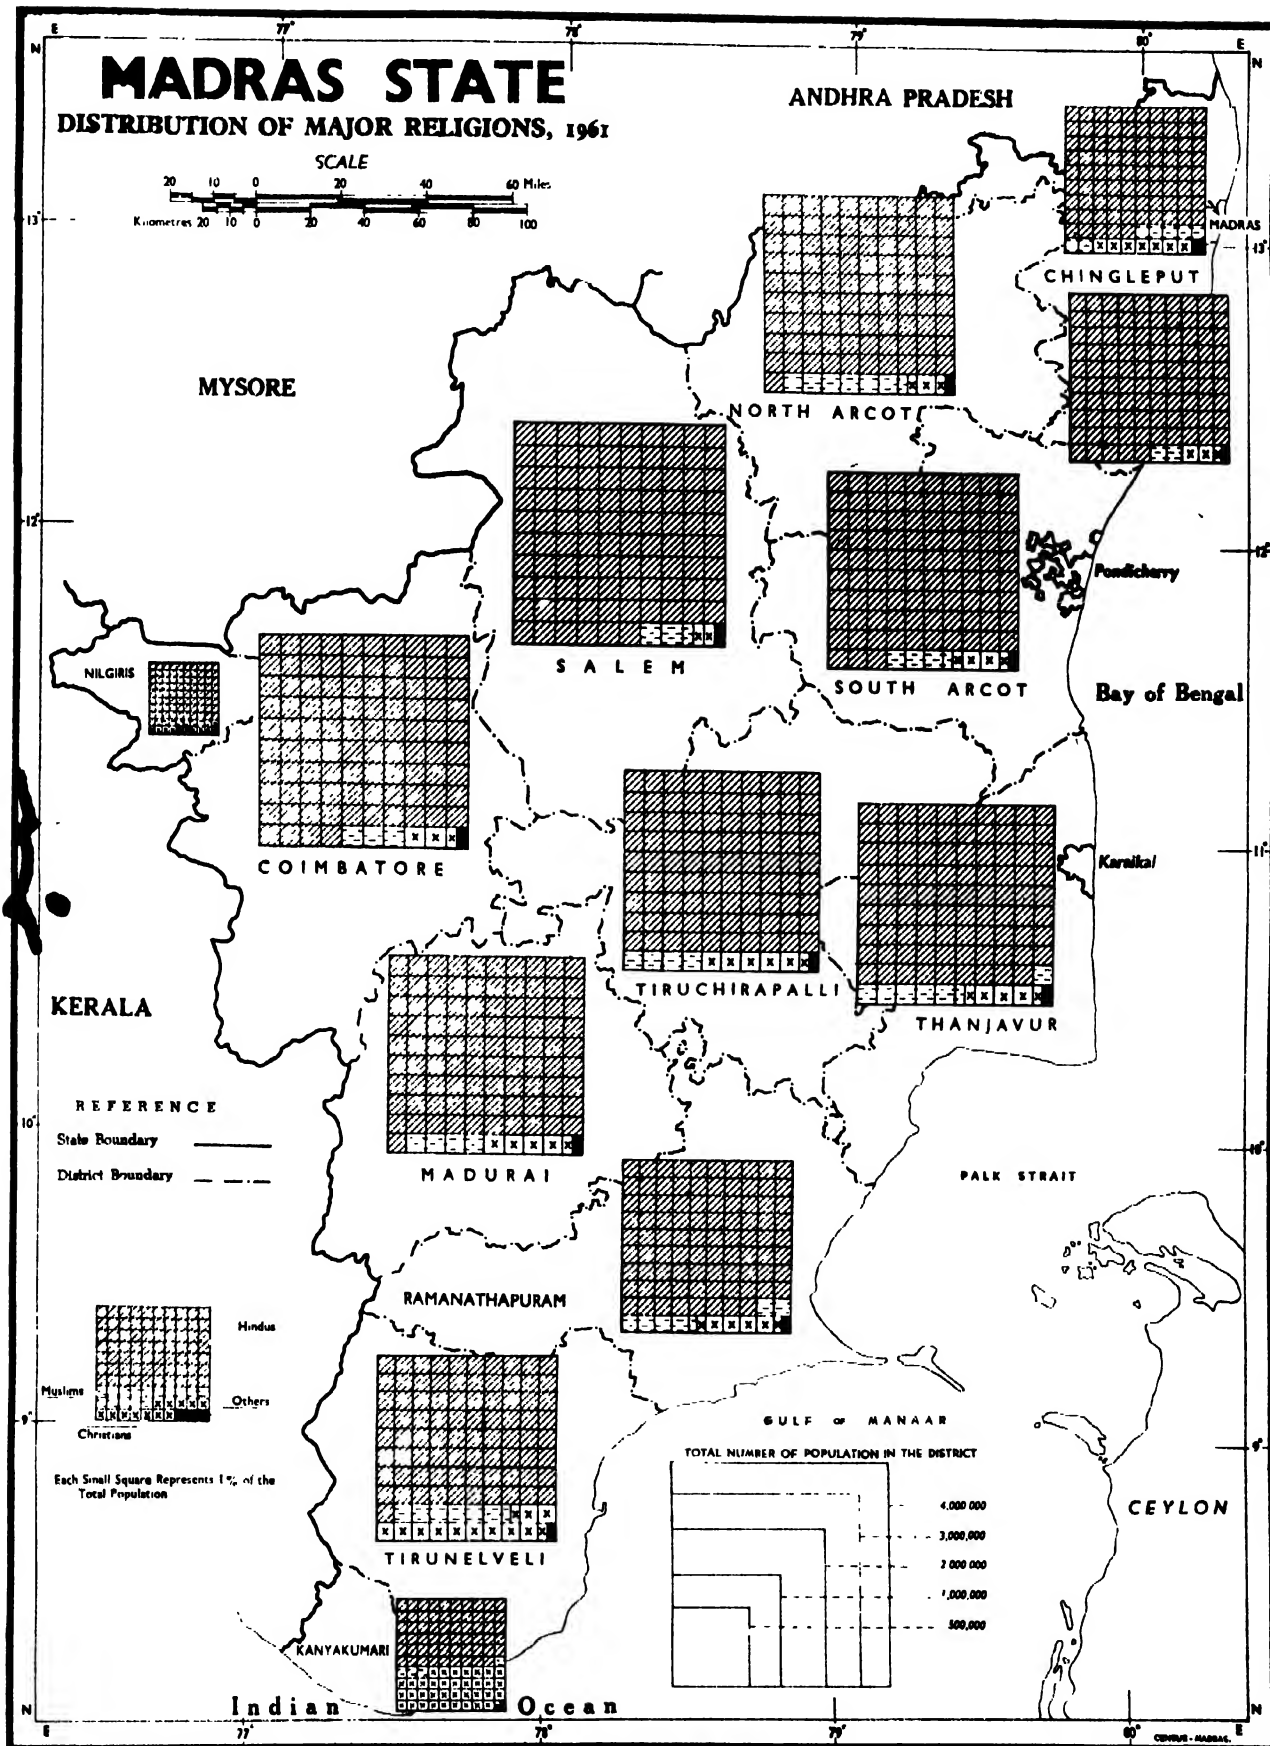

**Major religions**

8. It will be seen that only Hinduism, Islam and Christianity have any following in the State with 89.94%, 4.63% and 5.23% of the population under their fold. Of other religions, Jainism is the most significant, though it forms only 0.09% of the total population. Hindus are found in large numbers in all the districts, the only district with a lower proportion being Kanyakumari with 58.93%. This is due to the presence of a large percentage of Christians (36.90%) which portrays conditions prevailing in the southern parts of

Kerala. The highest percentage of Hindus is found in Salem district with 96.23%. Nilgiri has the lowest percentage of Hindus next to that of Kanyakumari, but it is still as high as 80.89%. Christians are found in all districts of the State, but in more concentrated form in Kanyakumari with 36.90% followed by Tirunelveli with 11.91%, Nilgiri with 10.72% and Madras City with 6.90%. The lowest percentage is recorded in Salem with 0.96%. 20.86% of the total Christian population in the State is concentrated in Kanyakumari and another 18.44% in Tirunelveli. There is a more even

# MADRAS STATE

DISTRIBUTION OF MAJOR RELIGIONS, 1961

distribution of Muslims in the State. Nilgiri has the highest percentage with 8.19% followed by Madras City with 7.49%. North Arcot, Thanjavur, Ramanathapuram and Tirunelveli have also percentages higher than the State average. The large percentage of Muslims in Nilgiri can be explained by the influx of Moplahs from neighbouring Kerala in search of work in plantations. North Arcot district has a belt in which Muslims are concentrated. This district has been noted for Hindu-Muslim differences in British days.

### Minor religions

9. 28,350 Jains are found in Madras State. They form only 0.09% of the total population. In none of the districts except Madras the percentage of Jains show more than 0.3% of the total population. Of them, 32.65% are in the district of North Arcot and 31.90% in Madras City. South Arcot district has 17.80% of all Jains. Buddhists number only 777 — an insignificant number. They are scattered in all

other districts except Kanyakumari. Of them, 47.11% are in Madras City and 18.41% in Chingleput district. Sikhs number 2,567 and form 0.01% of the total population of the State. Though they are found in all the thirteen districts, they are concentrated in the City of Madras with 27.65% and Chingleput district with another 25.98% of all Sikhs. They are generally migrants to Madras. Zoroastrians number 292. 58.56% of them are found in Madras City. 34,732 persons have been returned as belonging to other religions and persuasions. They are found in large numbers in Tiruchirapalli and Thanjavur. These two districts account for 61% of persons belonging to other religious groups. Of these persons, 34,382 have been returned as atheists. Madras had 8,659 atheists in 1951.

### Growth of Atheists

10. A remarkable increase has been recorded in atheism. The table given below illustrates the growth of atheism in different parts of the State:

TABLE XI — 2  
*Population returned under 'Atheism' in 1951 and 1961*

State/District	Population returned as Atheists			
	1951	1951	1961	1961
	Males	Females	Males	Females
1	2	3	4	5
Madras State	4,587	4,072	18,305	16,077
Madras	524	743	553	464
Chingleput	377	201	111	79
North Arcot	289	251	1,116	1,002
South Arcot	105	76	2,021	1,848
Salem	1,444	1,124	1,944	1,879
Coimbatore	190	186	123	104
Nilgiri	...	...	9	2
Madurai	60	30	526	359
Tiruchirapalli	670	640	5,016	4,415
Thanjavur	669	595	6,363	5,543
Ramanathapuram	190	135	316	227
Tirunelveli	69	91	138	93
Kanyakumari	N.A	N.A	69	62

Note: For 1951, the figures represent the district figures of 1951 Census and no adjustment has been made for changes in jurisdiction.

N.A—Not available.

In 1951 Salem had the highest number - 2,568. In 1961 Thanjavur and Tiruchirapalli are ahead of other districts under this head. The atheists are mostly found in the areas comprising North Arcot, Salem, South Arcot, Thanjavur and Tiruchirapalli. The growth of atheism in Madras State is indirectly influenced by the activities of two movements, the Dravida Kazhagam led by Sri Ramaswami Naicker and the Dravida Munnetra Kazhagam led by Sri C. N. Annadurai. The D. M. K. is the rebel group of D. K., but both represent the ideology of revolt against caste and ritual which has been sometimes claimed to be responsible for Brahmin domination of the South. This revolt and consequent propaganda has misled the younger generation who have identified it with Godlessness. Some of them have in their own enthusiasm returned themselves as atheists. A similar move was made by another section by

demanding that their religion should be returned as Dravidian. But this aspect has not been highlighted in Census Tables because Dravidians were treated as Hindus. From the present trend it is likely that more atheists will be returned in Madras State in 1971. As Hindu religion is to some extent based on temples in South India, any revolt against established order will compel the more forward sections to return themselves as atheists whether they believe in the state of Godlessness or not.

Atheists account for 99% of the total persons belonging to the classification 'other religious groups'. The rest is accounted for by Rationalists, Zoroastrians, Jews and Agnostics. The presence of these groups is however, not significant in the State. The table below gives the percentage of population belonging to other religious groups to the total population and the proportion of atheists per 1,000 of the population comprising other religious groups.

TABLE XI — 3

*Percentage of other religious groups to total population and proportion of Atheists per 1,000 belonging to other religious groups*

State/District	Percentage of other religious groups to total population	Proportion of Atheists per 1,000 persons belonging to other religious groups
1	2	3
Madras State	0.10	990
Madras	0.07	838
Chingleput	0.01	974
North Arcot	0.07	993
South Arcot	0.13	1,000
Salem	0.10	998
Coimbatore	0.01	934
Nilgiri	0.01	306
Madurai	0.03	932
Tiruchirapalli	0.29	1,000
Thanjavur	0.37	1,000
Ramanathapuram	0.02	1,000
Tirunelveli	0.01	967
Kanyakumari	0.01	1,000

**Variation in population of religious groups, 1951-61**

11. We may at this stage refer to the percentage increase of different religious groups during the period 1951-61. As against an increase of 11.85% in the general population, Hindus have

recorded 11.13% and Muslims 8.14%. Christians and Jains have increased their numbers with 23.51% and 27.90% respectively. The Buddhists have recorded a fall during the period (-34.10%). In terms of absolute figures, their number fell from 1,179 in 1951 to 777 during 1961.

TABLE XI — 4

*Variation in population by main religions 1951-61*

Major religious groups	Number of persons		Percentage increase or decrease during the decade 1951-61
	1951	1961	
1	2	3	4
Total population	30,119,047	33,686,953	11.85
Hindus	27,212,641	30,297,115	11.13
Christians	1,427,382	1,762,954	23.51
Muslims	1,442,935	1,560,414	8.14
Jains	22,165	28,350	27.90
Sikhs	2,386	2,567	7.59
Buddhists	1,179	777	(- )34.10
Others	10,359	34,776	235.71

Source : Census of India Paper No. 1 of 1963 — 1961 Census — Religion

Hindus have maintained the rate of growth which is nearer to the increase in the general population in the Madras State. This is natural as Hindus are numerically the major religious community in the State. The fall in the rate of growth of Muslims is striking. It is likely that consequent on the formation of Pakistan, more

people have migrated from the State. There is a remarkable increase of 235.71% in other religious groups. This is chiefly contributed by atheism.

12. The table below shows the distribution of 10,000 of population belonging to religions other than Hinduism among the districts.

TABLE XI — 5

*Distribution of each major religious community other than Hindus  
among the districts of the State, 1961*

State/District	T R U	Muslim	Christian	Sikh	Buddhist	Jain	Others
1	2	3	4	5	6	7	8

TABLE XI — 5 (Contd.)

*Distribution of each major religious community other than Hindus among the districts of the State, 1961*

State/District	T R U	Muslim	Christian	Sikh	Buddhist	Jain	Others
1	2	3	4	5	6	7	8
Tiruchirapalli	T	823	974	374	193	74	2,713
	R	793	987	89	262	...	2,664
	U	845	946	499	171	131	2,792
Thanjavur	T	1,305	689	1,317	283	267	3,425
	R	1,995	766	1,033	628	72	3,811
	U	799	529	1,441	171	415	2,804
Ramanathapuram	T	1,005	741	105	116	20	156
	R	1,355	938	89	419	6	99
	U	748	331	112	17	30	249
Tirunelveli	T	1,175	1,844	168	746	18	69
	R	955	1,940	293	314	...	36
	U	1,336	1,644	112	887	32	124
Kanyakumari	T	266	2,086	70	...	1	38
	R	444	2,762	13	...	2	10
	U	135	687	95	...	1	83

The bulk of the Christians are found in Kanyakumari and Tirunelveli districts. Muslims are concentrated in a belt consisting of Tirunelveli and Ramanathapuram and in Thanjavur, South and North Arcot districts. Thanjavur and Tiruchirapalli account for more than 61% of persons belonging to other religious groups. Jains are found mostly in North Arcot, Madras and Chingleput districts.

#### **Distribution of Religious Groups in Rural and Urban areas**

13. An interesting point is the distribution of

persons belonging to different religious groups in rural and urban sectors of the State. A small inset table is presented below. Hindus and Christians have more than 50% of their followers in the rural areas. Actually, more than 75% of the Hindus have been enumerated in the rural sector which is, as it should be expected, because 73% of the total population of the State live in rural areas. Thus a high preference is shown by non-Hindus in the urban areas. The percentage of Christians living in rural areas is 67.47. The percentage of Muslims is lower — 42.29.

**TABLE XI -- 6**  
*Percentage of population professing different religions and living in the rural sector*

Religious group	Percentage of rural population to total population
1	2
Total Population	73.31
Hindus	75.30
Christians	67.47
Muslims	42.29
Jains	43.03
Buddhists	24.58
Sikhs	30.54
Others	61.73

#### Religion by sexes

14. The sex break-up of religions will provide another interesting study. The proportion of females of these groups varies from 50.55% among Muslims to 33.27% among Sikhs. All groups, except Sikhs have recorded a fall in the

female ratio which is in accordance with the general decline recorded during 1951-61. The changes in female ratio are reflected both in percentage of females to total population in the groups as well as in the proportion of females per 1,000 males in each group.

**TABLE XI — 7**  
*Percentage of females and proportion of females per 1,000 males by religion, 1951 and 1961*

Religions	Percentage of females to total population of the respective group		Percentage variation in female proportion	Proportion of females per 1,000 males	
	1951*	1961		1951*	1961
1	2	3	4	5	6
Total population	50.19	49.80	(-) 0.39	1,007	992

### DISTRIBUTION OF MAJOR RELIGIONS IN URBAN AREAS, 1961.

**CENSUS - MADRAS**

Indian 150,079 Ocean

The female ratio among Jains and Muslims has declined more appreciably. Christians have recorded a smaller decline. The decline is the lowest among Hindus. The Sikhs have shown an upward trend in female ratio, that is from 452 in 1951 to 499 in 1961.

#### Growth of major Religious Communities in the State compared with All India Pattern

15. I will now discuss the pattern of the growth of 6 major religions in the State against the All-India background. In India, the number of Buddhists went up from 1,80,823 in 1951 to 32,50,227 in 1961. The population of Buddhists to total population rose from 0.05% in 1951 to 0.74% in 1961. The decadal percentage increase of Buddhists was as high as 1607.71. This striking increase has been largely due to the Neo-Buddhist movement which swept the country during the decade. The movement has been very pronounced in States like Maharashtra, Madhya Pradesh and less pronounced in other States and Union Territories, except Madras, Orissa and Rajasthan which have recorded proportionate as well as actual decrease in the Buddhist population. Actually in Madras, there was a fall of 34.10% that is, 1,179 Buddhists became 777. The following districts have recorded an increase of 50% or more among Buddhists during 1951-61 in Madras State :

Salem	...	1440.00
Tirunelveli	...	1350.00
Chingleput	..	155.36
Thanjavur	...	83.33
Coimbatore	...	62.50
Tiruchirapalli	...	50.00

No consistent pattern can be observed in the movement of population among Christians. In some States like Gujarat and West Bengal, the rate of increase has been low and much below the average for the State. In some others, there has been an absolute decline in the number from 1951 to 1961, as in Uttar Pradesh. All other States have maintained a normal growth and Madras is one of them. In the following districts, the growth rate of more than 30% has been shown — Salem, North Arcot, South Arcot, Chingleput and

Madurai. Madras with an increase of 8.27% and Nilgiri with an increase of 1.87% have fallen behind the State average for this religious community.

Being numerically a major religious community, the rate of growth of Hindus is the closest to every State to the general rate of growth. Only in Maharashtra, has the proportion of Hindus to total population declined substantially during 1951-61. Punjab has shown a growth rate as high as 30.86%. All other States including Madras have followed the normal pattern. The following districts show a growth rate of more than 25% during the decade among Hindus :

Nilgiri	...	35.74%
Madras	...	27.11%

This may be due to the influx of Hindus from other areas to these districts.

Jains have recorded a low growth in Gujarat, Punjab and Rajasthan, but majority of States have recorded high increases. The rate of growth of Jains is 27.90% in Madras State as against 11.85% for the general population. The following districts of Madras State — Madurai, Ramanathapuram, Tirunelveli, Coimbatore, Nilgiri, Chingleput, Madras and Tiruchirapalli have shown high rates of increase. Madurai has a rate as high as 5568.75%, and Ramanathapuram has a growth rate of 366.67%. As against these, North Arcot has a low rate of 5.04%, while in Salem the Jains have declined by 31.88%. Gujarat, Punjab and Rajasthan are the major States which have recorded low rates of increase in Jains than the general population. While all other States have experienced higher growth rates, it is most pronounced in the States of Andhra Pradesh, Kerala, Orissa, Assam, West Bengal, Maharashtra and Bihar.

The rate of growth of Muslims is perhaps the lowest in Madras State, being 8.14%. Nilgiri has recorded a higher increase of 38.08% while Madras City has recorded a decline of 7.74%. The rate of growth in North Arcot and Ramanathapuram is as low as 1.62% and 2.02% respectively. Chingleput, Tiruchirapalli and Thanjavur have recorded less than 10% increases.

The following districts in Madras State have recorded increases above 30% among Sikhs, during the decade 1951-61 ;

Thanjavur	...	2972.73
Salem	...	296.43
Ramanathapuram	...	237.50
Tiruchirapalli	...	108.70
Coimbatore	...	93.41
Chingleput	...	52.63
Madurai	...	32.26

Madras City has recorded a fall of 29.77% while North Arcot declined by 61.87% and South Arcot by 65.44%.

The All-India increases and Madras increases by different religious groups are given below :

	<i>All-India</i>	<i>Madras</i>
Buddhists	1670.71 (—)	34.10
Christians	27.38	23.51
Hindus	20.29	11.13
Jains	25.17	27.90
Muslims	25.61	8.14
Sikhs	25.13	7.59
Others	(—) 13.07	235.71

In general, the rate of increase in Madras is less for all religious groups, except Jains which is comparable. A remarkable variation is found among 'Others' in that, Madras has a high rate of

increase of 235.71% which has been explained earlier.

#### Religious affiliation of Scheduled Tribes

16. Scheduled Tribes in the State have returned their religions as Christian, Hindu and Muslim and a few have not stated their religion. No tribal religion has been returned in this State. The table below indicates the total population of the Scheduled Tribes with break-up by religion. The relative strength of the religious groups as a percentage of the Scheduled Tribe population is also presented.

TABLE XI -- 8

#### *Scheduled Tribe population classified by religion*

Category	Population	Percentage to total population
1	2	3
Total population	251,991	100.00
Hindus	251,486	99.80
Muslims	12	0.01
Christians	487	0.19
Religion not stated	6	N

N -- denotes negligible figures.

## CHAPTER XII

### WORKING POPULATION

#### Part — A — General

1. In this chapter, I propose to discuss the working population of Madras State. In any planning we undertake, the data relating to the working population are of particular significance. Nor can the economic progress of any country be measured except in terms of its working force. In 1961 Census, special attention has been devoted to this concept. The entire population has been divided into working and non-working population, in other words "Worker" and "Non-worker". Non-worker will include not only the young who in due course will help us in building the country but also those who are a burden to society, the aged and infirm.

I reproduce below the definition of work adopted in 1961 in the language used by the Registrar General, India.

#### Definition of Workers and Non-workers

##### 2. (a) For persons working

The basis of work will be satisfied in the case of seasonal work like cultivation, livestock dairying, household industry, etc. if the person has had some regular work of more than one hour a day throughout the greater part of the working season. In the case of regular employment in any trade, profession, service, business or commerce the basis of work will be satisfied if the person was employed during any of the fifteen days preceding the day on which you visited the household. If on the check or revisional round such a person is found to be unemployed no change in the original entry should be made. A person who is working but was absent from his work during the fifteen days preceding the day on which enumerated or even exceeding the period of fifteen days due to illness or other causes should be treated as worker. A person who has been offered work but has not actually joined should be treated as non-worker. Work includes not only actual work but effective supervision and direction of work.

Persons under training as apprentices with or without stipend or wages will be regarded as working.

An adult woman who is engaged in household duties but doing no other productive work to augment the family's resources should not be considered as working for purposes of this question. If, however, in addition to her household work she engages herself in work such as rice pounding for sale or wages, or in domestic services for wages for others or minding cattle or selling firewood or making and selling cowdung cakes or grass, etc. or any such work, she should be treated as a worker.

Persons like beggars, pensioners, agricultural or non-agricultural royalty, rent or dividend receivers, who may be earning an income but who are not participating in any productive work should not be treated as working unless they also work in cultivation, industry, trade, profession, business or commerce.

A public or social service worker who is actively engaged in public service activity or a political worker who is also actively engaged in furthering the political activity of his party will be regarded as a worker.

##### (b) For person not working

The following activities should be recorded in case of persons Not Working :

1. For a full-time student or child attending school who does no other work such as make articles at home for sale, nor even help part-time in his own family cultivation, industry, trade or business ... Write ST
2. For a person engaged in unpaid home duties (like house-wife or other adult female) who does no other work, such as make articles at home for sale or wages nor help regularly even part-time in family cultivation, industry, trade or business ... Write HW

3. For any dependent, including an infant or child not attending school, a person permanently disabled from work because of illness or old age ... Write D
4. For a retired person who is not employed again, rentier, person living on agricultural or non-agricultural royalty, rent or dividend or any other person of independent means for securing which he does not do work and who does no other work ... Write R
5. For a beggar, vagrant or independent women without indication of source of income and others of unspecified source of income ... Write B
6. For a convict in jail (an under trial prisoner will be shown as a worker if he used to work before he was apprehended) or an inmate of a penal, mental or charitable institution ... Write I
7. For a person who has not been employed before but is seeking employment for the first time ... Write NE
8. For a person employed before but now out of employment and seeking employment ... Write UN

**Explanation :—**If a person who does not work, cannot be readily classified in any of the above categories, put him in category 5 and write B in the question. A retired person who has taken up regular work again should not be entered in this question as he would have been entered for his new work.

A person who is not working but has been offered work which he has not joined should be included in item 3 and 'D' should be written. He should not be included in items 7 or 8."

In order to understand the exact scope of the definition adopted in 1961, it is necessary to know what has been done in 1951. The concept of a worker or non-worker was not used in 1951 or earlier Censuses. The population has been divided into three categories — self-supporting person, earning dependent or non-earning dependent. Every person who is in receipt of any income every year whether in cash or kind is an earner and such persons have to be classified as

self-supporting persons or earning dependents. It was not sufficient if a person merely worked for the benefit of the household. He must actually earn an income as a result of such work. A housewife who only cooks for the family and brings up the children was therefore classified as a non-earning dependent. If two or more persons jointly secured an income either by joint cultivation of land or other business, each of them was an earner and should be classified as a self-supporting person or an earning dependent with respect to the share of the joint income attributable to him. The criterion for classification of a person as a self-supporting person was not whether his income was sufficient for the subsistence of himself and the others depending on him or living with him but whether it was sufficient for his own maintenance. Any person who was earning but whose income was not sufficient even for his own maintenance should be treated as an earning dependent. If a person did not earn any income in cash or kind, he should be treated as a non-earning dependent. It would, therefore, be obvious that a complete departure has been made in the Census definition of work from 1951 to 1961.

The interesting features of the definition adopted in 1961 Census can be briefly indicated as follows : A full-time student or child attending school is a non-worker, but if he or she assists the parents in family cultivation, industry, trade or business for more than one hour a day throughout the greater part of the working season, he will be classified as a worker. In the rural parts of Madras State, students do help their parents at home and even in cultivation. It is not my purpose to under-estimate the quantum of work they do but it means classification of a large number of non-workers as workers in Census Statistics. A similar problem would arise in the category of housewife. A person engaged in unpaid home duty was deemed to be a housewife, provided she did not do any other work such as making articles at home for sale or wages nor help regularly in the family cultivation, industry, trade or business. It is likely that a housewife may assist her husband for a short period in doing household cultivation or household industry. Such a housewife will become a worker. It is always difficult to estimate the role

played by housewife especially in the field of family cultivation and agricultural labour or household industry. It would, therefore, appear that the definition of a worker is inclined to be generous and has imported a large number of students and females as full time workers, thereby inflating the working population of Madras State. In previous Censuses, they were not even termed as working dependents.

### **Methods of collecting data on economic characteristics**

3. What is the background of the change adopted in 1961 by Indian Census? There are two methods of collecting economic characteristics — gainful worker approach and labour force approach. In 1951 Census, 49 out of 52 countries adopted labour force approach. India was one of the three countries which made the gainful worker approach in 1951. In 1961, a modified form of labour force approach was adopted in India. It broke the continuity of the concept of Census data. It was felt that in keeping with the changing pattern of the economy from subsistence to wage, the adoption of planning as a tool for economic development and fast industrial growth, changes in the concept and tool of economy were desirable. The gainful worker approach is based on the idea that each person has more or less a stable functional role either as a bread winner or as a housewife or a student. This role is to some extent independent of his or her activity in a brief interval of time and is based on the usual status. The labour force approach is, on the contrary, based on the individual's activities during a definite and brief time interval. It is claimed that in gainful approach, the data will be less influenced by temporary conditions at the enumeration period. The vexatious questions on suitability of the time period will not arise and less complex questions and instructions can be used. Labour force approach gives a better approximation of labour supply and can be more easily linked to employment statistics from other sources. As it is based on particular period of time, it can be more objectively defined than usual status.

Though internationally both the methods have been recognised, the Sixth International Conference of Labour Statisticians has endorsed the labour

force concept for adoption. It was also felt by the Indian Census Authorities that the difference between the two approaches has been largely exaggerated and that basically both refer to the same concept and the main difference results from the way in which the questions are actually formulated. The chief difference is in the treatment of persons who support themselves wholly or partly by pensions, rents, dividends and royalties. They will be classified as self-supporting or earning dependents under gainful approach and as economically inactive under the labour force approach. However, India has not adopted labour force method without any change. Unemployed are normally treated as economically active group in the sense that they can supply labour for the production of goods and services. But in Indian Census, workers are those engaged in productive work and as such, do not include unemployed. The working force is thus distinct from labour force, the difference representing the quantum of unemployment in the country. The justification for this change is the consideration that in Indian economy in which the traditional subsistent sector and modern industrial sector co-exist the economy cannot be measured in terms of refined methods adopted in more advanced countries. The other changes made in the international approach are: (i) The reference period has been reduced from 30 to 15 days in Indian Census. (ii) The minimum period of daily work is three hours under U. N. definition. It has been reduced to one hour. A person engaged in seasonal occupation like cultivation, livestock and household industry has been treated as a worker if that person had some regular work for more than an hour a day during the greater part of the working season. As unemployed has been separately enumerated under non-workers, it is possible to collect the total economically active population. Thus in reality, the Indian approach is in tune with the labour force approach adopted by most of the countries in spite of the changes referred to earlier.

The old pattern divided the population into self-supporting, earning dependents and dependents. In 1961, the concept of dependency has been eliminated altogether. That a section of the working population has to depend on some others for their livelihood cannot admit of any dispute. As

such, the picture becomes unrealistic when the entire population is divided into ten broad categories and no reference is made to workers who have to depend on others. Any economic activity can be measured in terms of income and the fundamental question whether a particular work is sufficient to support a person or his family is relevant for planning or assessment of national income. Added to this is the problem of enumeration of the number of workers. The number of working population of Madras State has recorded an abnormal increase. The figures of 1961 are more comparable with that of 1931. These aspects will be elaborated in the later parts.

A mere refinement in concept will not result in the collection of better or more useful data. The vast majority of the population are illiterates. Social and cultural value of work differs from community to community and this influences the respondent to answer in a particular way. Thus in the ultimate analysis, the quality of the data will depend on the ability of the respondent to answer and the skill of the enumerator to question.

### **Economic Classification**

4. In 1961 Census, the single economic classification which was neither industrial nor occupational was given up. The international classification was adopted. The unit of industrial classification was the establishment in which the industrial worker was working, the basis was the sector of economy in which he was engaged and the system adopted is known as Indian Standard Industrial Classification. The unit of occupational classification was the individual worker, the basis was the activity or the exact function the worker was performing and the system adopted is known as National Classification of Occupation. In view of the importance of small unorganised industries run by the household, the concept of household industry was defined and treated as a separate sector of economic activity. Taking into consideration the organisational difference in the household industry in rural and urban areas, an industry not run in the scale of factory conducted by the head of the household himself and other members of the household concerned with production, processing, servicing,

repairing or making and selling of goods and run at home or within the village in the rural area and only at home in urban area was treated as household industry. Another significant innovation was the treatment of household as an economic unit. Household schedule was prepared for each household wherein details regarding cultivation and household industry in which household was engaged were recorded. In India, cultivation in which majority of the people are engaged is not only a means of living but a way of life itself and is conducted as a joint household enterprise. Household industry is also in some cases a compulsory adjunct to cultivation. Particularly in the case of households which produce primarily for self-consumption and only additionally for the market, the household and not the individual is the integral unit of production. Thus, 1961 Census has enriched in many ways the data on the economic activity of the people.

### **Individual Slip**

5. As indicated earlier, data on economic characteristics were collected through the individual slip and household schedule. The questions asked and the instructions given to the enumerators to record answers are reproduced below :

#### **A. Individual Slip :**

- (i) 8. Working as cultivator
9. Working as agricultural labourer
10. Working at household industry
  - (a) Nature of work
  - (b) Nature of household industry
  - (c) If employee
11. Doing work other than 8, 9 or 10
  - (a) Nature of work
  - (b) Nature of industry, profession, trade or service
  - (c) Class of worker
  - (d) Name of establishment
12. Non-workers

#### **(ii) Instructions to enumerators : (Annexure-I)**

### **Economic Questions in the Decades**

6. In order to understand the continuity of the economic questions, a statement has been prepared indicating the questions put from 1881 to 1961. (Annexure-II) Only one question was put in 1881 and 1891. Three questions were put in the Censuses of 1901, 1911 and 1921. They

related to the principal occupation, subsidiary occupation, if any, and the principal occupation or means of subsistence of the actual worker on whom the dependents depended. In 1911 and 1921, statistics relating to industrialists were obtained by a special industrial return. In 1931 this was included as a question in the regular Census schedule. Thus in 1931, a person was classified as earner or dependent separately based on the merit of the case. The term 'means of livelihood' was given up and the term 'occupation' was adopted. But in 1941, 'means of livelihood' was again used. Eight questions were put in 1951. The questions were again limited to three. One recorded the economic status, dependency and employment and the other two related to the principal means of livelihood. In the case of earning dependents, the work of the person on whom they depended was recorded as principal means of livelihood and the work from which the earning dependents derive income was recorded as subsidiary means of livelihood. The status of livelihood like employer, employee and independent worker was also recorded.

### **Economic Concept during the Decades**

7. The concept of worker has undergone material changes during 1881 to 1961. In 1881 no distinction was made between earners and dependents, workers and non-workers. Occupation of every male who was of age to do work and the chief source of income were recorded. In 1891 a distinction was made between dependents and non-dependents. In 1901 the actual workers were distinguished from mere dependents. A worker was defined as one who actually did work whether personally or by means of servants or carried on business or had an occupation or private property which brought him income. Only the absolutely idle was classified as dependent.

In 1911 and 1921, no change was made in the definition of workers and dependents. However, in 1921, children and women earners were also treated as workers if any work was done by them to augment the family income. In 1931 a person was classified as an earner or dependent for the first time in Census history. An earner was defined as one who had a distinct individual means or partial means of livelihood. He need not be self-supporting nor need he actu-

ally work and have money income. An intermediate category of working dependents was also introduced in 1931. A person who contributed anything in cash or in kind towards support of himself or the family but which was not definitely adequate to be self-supporting was classified as working dependant. This was introduced to meet the prevalence of joint family system in India in which various members of the household depend on the labours or earnings of one, even though they make some contribution towards family maintenance as a whole.

The extent of this practice and the total number of people supported indirectly were ascertained. Those who did not have a distinct individual means or partial means of livelihood were classified as dependents. It would be interesting to recall the observations of Mr. Yeatts on this change :

"Previously the attitude was to find out the occupation and attach to it either direct practitioners or persons dependent upon those practising. Thus the entire population was linked up to some occupation or other either directly or through dependence. At this Census, each person had to be classified as an earner or dependent on the merits of his case. The change gave considerable difficulties and in particular the use of "dependent" was unfortunate. "Dependent" means to the ordinary Indians who formed our supervisors and enumerators, a person who is supported by some one else. Under the actual Census use this term "dependent" might include some person who had some occupation, i. e. means of livelihood. Much ingenuity had to be expended in solving problems and difficulties and in exhibiting these to the enumeration staff. The choice of terms is particularly important in Census phraseology, at any rate under a Census conducted on the present lines where 400,000 enumerators are employed in Madras Province. It is impossible to reach these directly and much has of necessity to be left to intermediate agencies. The importance of selecting terms free from dubiety is obvious. 'Occupation' itself gave rise to considerable doubts, some of them of an amusing nature. The literal Indian mind found it difficult to believe that a man who simply sat, as one of my superiors put it, could be said to have an 'occupation'. In such cases, I pointed to the alternative title "means of

livelihood" and by this means was able to secure an understanding of the position. I would suggest in future abandoning the use of the term 'occupation' altogether and confining ourselves to 'means of livelihood'. This phrase is directly translatable into all South Indian languages by words which convey an immediate meaning to even the ordinary man".

In 1941 the term 'earner' was given up. The concepts of 'full dependent' and 'partial dependent' were introduced. As the results of the Census were not tabulated in most parts of the country, the effect of the change could not be studied.

### **Industrial and livelihood Classification**

8. In 1951, the concepts of self-supporting persons and earning dependents were re-introduced. A self-supporting person was defined as a person who earned sufficient to maintain himself while an earning dependent was defined as one whose earning was not sufficient to maintain himself. As already pointed out, a complete departure has been made in 1961 which is to a great extent

similar to the concept adopted in 1921. The population has been divided into workers and non-workers based on productive work.

It will also be desirable to refer in brief to the scheme of presentation of population by livelihood classes. Upto 1951 the data were presented for workers and dependents separately at each category of work. The dependents were recorded under the category of work done by the persons on whom they depended. In 1951 the whole population was divided into 8 livelihood classes. Under each class, the figures for self-supporting persons, earning dependents and non-earning dependents were furnished separately. There were 4 agricultural classes and 4 non-agricultural classes. In 1961 the population has been divided into workers and non-workers. The workers have been further divided into 9 industrial categories based on the establishment in which they work. The following statement presents the livelihood classes of 1951 and industrial categories of 1961:

#### *Livelihood classes, 1951*

##### **Agricultural Classes**

- I. Cultivators of land wholly or mainly owned and their dependents
- II. Cultivators of land wholly or mainly unowned and their dependents
- III. Cultivating labourers and their dependents
- IV. Non-cultivating owners of land, agricultural rent receivers and their dependents

##### **Non-agricultural classes**

- V. Production other than cultivation
- VI. Commerce
- VII. Transport
- VIII. Other services and miscellaneous sources

#### *Industrial categories, 1961*

- I. As cultivator
- II. As agricultural labourer
- III. In mining, quarrying, livestock, forestry, fishing, hunting and plantations, orchards and allied activities
- IV. At household industry
- V. In manufacturing other than household industry
- VI. In construction
- VII. In trade and commerce
- VIII. In transport, storage and communication
- IX. In other services
- X. Non-workers

### Merits and Demerits of classification

9. This change in the basis of classification has both merits and demerits. The division of population into earner and dependent is of advantage in a subsistence economy and is useful in compiling national income and framing of budget. It is easy to classify the earner and dependent into several groups by broad sectors of national economy thereby pigeon-holing the population into a small number of neat and apparently mutually exclusive compartments. This classification can also be unsatisfactory in a wage economy. Presentation of data on workers according to principal means of livelihood not linked with income but with productive activity and presenting them under industrial categories based on industrial establishments in which they work gives a better picture of the pattern of economy and highlights the relative importance of traditional and modern sectors. As it is based on the international model, it can be compared with the data relating to other countries more easily. Such presentation also helps us to know the demand for labour in various sectors. The aim in the census has been to present data in a manner which will indicate the relative size of the traditional and emerging modern sector, the extent to which they jointly prevail and the extent of transformation of economy. The classification has been so done as to secure a measure of comparability of past data and to specify the areas of non-comparability. In other words, the presentation of data relating to household industry is a useful improvement as regards the estimation of national income. Thus, the presentation of economic data in 1961 is a progressive step in attaining a more balanced and scientific method.

### Difficulty in Comparability

10. From the foregoing, it will be clear that comparison of the data between 1951 and 1961 is difficult. No data on household industry have been collected in 1951. Sri Kalra of Registrar General's Office has evolved a formula to facilitate comparison. A statement has been prepared on the basis of his formula indicating the break-up of workers in 1951 and 1961. The conceptual changes have to be kept in mind while undertaking a comparison. The concept of cultivation has undergone some change from 1951

to 1961. Persons who have received rent or lived on income of property without contributing anything to production have been classified as non-workers in 1961. They were treated as self-supporting persons in 1951. A large number of female workers who were not even classified as earning dependents in 1951 has been returned as full workers in 1961. This is more marked in the sectors of agriculture and household industry. However, the formula of Sri Kalra may be useful in understanding in a comparative manner the trend of the movement of working force in 1951 and 1961. The Registrar General has indicated that there could be an excess participation of females in 1961 which could to some extent be explained as due to the drop in enumeration at the previous Census. The basis of enumeration in 1951 was that a self-supporting person or an earning dependent or a non-earning dependent should be distinguished clearly. This meant that any member of the household participating in the work of the household whose income was not measured in terms of cash or kind was excluded from the classification as self-supporting person or non-earning dependent. The criterion adopted was the contribution of a regular earned annual income however small whether in cash or in kind or both for the maintenance of household. This was literally applied in Madras State in 1951. In order to understand the implications of this, an attempt has been made by me to apply the principle enunciated in 1951 to the population data collected during socio-economic surveys in Madras. The results are discussed below.

### Comparative study of data based on 1951 Principle and 1961 Principle

11. Arkavadi in South Arcot district and Odaimarichan in Kanyakumari district were selected for this purpose. Arkavadi has a population of 726 persons consisting of 384 males and 342 females. It has recorded 379 persons as workers consisting of 248 males and 131 females. In other words, 52.2% of the population, 64.6% of the males and 38.3% of the females have been recorded as workers as per 1961 Census definition. Applying 1951 principles, only 159 persons consisting of 151 males and 8 females can be treated as self-supporting persons. 50 persons consisting of 30 males and 20 females can be treated

as earning dependents and the rest as non-earning dependents.

Odaimarichan has a population of 2,545 persons consisting of 1,224 males and 1,321 females. It has recorded 1,329 persons as workers consisting of 660 males and 669 females. In other words, 52.2% of the population, 53.9% of the males and 50.6% of the females have been recorded as workers as per 1961 Census definition. Applying 1951 principles, only 558 persons consisting of 454 males and 104 females can be

treated as self-supporting persons. 390 persons consisting of 118 males and 272 females can be treated as earning dependents and the rest as non-earning dependents.

The earning dependents and self-supporting persons together should correspond to the workers of 1961 Census. But it is found that the definition of 1961 is so liberal that even non-earning dependents have been returned as workers. The following statement presents the comparative position in these two villages.

TABLE XII — 1(b)

Name of Village : Odaimarichuan

Total No. of Schedules : 558

Total workers 1951																
Total population				Total workers 1961			Self-supporting persons			Earning dependents			Non-earning dependents			
							P	M	F	P	M	F	P	M	F	
1	2	3		4	5	6		7	8	9	10	11	12	13	14	15
2,545	1,224	1,321		1,329	660	669		558	454	104	390	118	272	1,597	652	945
% of workers for the year 1961				52.22	53.92	50.64		...	...	...	...	...	...	...	...	...
% of self-supporting persons to total population 1951				21.93	37.09	7.87		...	...	...	...	...	...	...	...	...
% of self-supporting persons and earning dependents to total population. 1951				37.25	46.73	28.46		...	...	...	...	...	...	...	...	...
Increase in total workers (1961 workers - 1951 self-supporting persons)				771	206	565		...	...	...	...	...	...	...	...	...
% increase over 1951 figure				138.17	45.37	543.27		...	...	..	...	...	...	...	...	...

The difference between the number of self-supporting persons and the workers is the difference that arises purely due to the liberal definition of worker. In Arkavadi this difference amounts to 220 persons, 97 in respect of males and 123 in respect of females. The percentage increase is therefore 138.4% in the total, 64.2% in the case of males and 1,537.5% in the case of females. In Odaimarichan the difference amounts to 771 persons, 206 males and 565 females. In other words, the percentage increase amounts to 138.2% for the total, 45.4% in the case of males and 543.3% in the case of

females. The quantum of inflation in both the villages is not only high, but similar. In both the villages, the increase among males ranges from 45 to 65 while for females the increase is phenomenally high. The inflation is chiefly due to the change in the definition which provided for the inclusion of a large number of family workers as workers.

Even if the earning dependents are also considered as workers though their earning is inadequate, the percentage of increase over 1951 figure continues to be high, particularly among females in both villages.

	Arkavadi			Odaimarichan		
	Persons	Males	Females	Persons	Males	Females
% increase over 1951 (Workers 1961-1951 self supporting persons)	138.36	64.24	1537.50	138.17	45.37	543.27
% increase over 1951 (Workers 1961-self supporting persons + Earning dependents)	81.34	37.02	367.86	40.19	15.38	77.93

This indicates that 1961 Census definition has not only brought in its fold persons whose work is insignificant and whose income is insufficient but also the pure dependents.

The following statement presents the category-wise increase. The categories adopted are as in the socio-economic survey.

TABLE XII — 2(a)

Village: Arkavadi

Category	Workers 1951		Earning dependents		Non-earning dependents		Workers 1961		% of total increase shared by each category (Total increase 100.00)

Increase in 1961 over 1951 figure	...	...	...	...	...	...	(69)	(395)	...	...
% increase	...	...	...	...	...	...	43.67	705.36	33.50	69.91
Business (Trade)	27	...	5	13	27	54	33	7	...	...
Increase in 1961 over 1951 figure	...	...	...	...	...	...	(6)	(7)	...	...
% increase	...	...	...	...	...	...	22.22	...	2.91	1.24
Other services (General labourer, agricultural labourer, servants etc.)	134	40	35	96	168	230	221	136	...	...
Increase in 1961 over 1951 figure	...	...	...	...	...	...	(87)	(96)	...	...
% increase	...	...	...	...	...	...	64.92	240.00	42.23	16.99
Total	454	104	118	272	652	945	660	669	100.00	100.00

The highest increase is under cultivators and the category of other services in which the agricultural labourer and general labourer have been included. 50% of the increase in male workers is accounted for by cultivators and 47% by other services. Almost the whole increase among female workers is under this category of agricultural labourers and general labourers, i.e. 119 out of 123 forming 97%. The percentage increase in this category amounts to 139.4% in the case of males and 1487.5% in the case of females.

In Odaimarichan in the increase in male workers 42% is in the category of other services (agricultural labourers, general labourers) and 34% in household industry. In the case of increase in female workers, 70% is accounted for by the category of household industry and 17% by other services. The increase in these categories clearly indicates that the inflation is due to the increase of persons, particularly females, who just do casual work. The quantum of inflation may vary from village to village and from area to area, but the change in definition has brought in a large number of persons whose contribution to the maintenance of the family is insignificant. In 1961 Census, a view has been taken that even though their contribution to economic productivity may be insignificant, the fact remains that they contribute something to production and so they should be treated as workers. It is perhaps desirable that this view is accepted for future Censuses also.

#### Statement of comparability

12. Sri Kalra has attempted a comparison of the figures of 1951 and earlier decades for Madras State and India. The comparative statement prepared by him is presented as an appendix to this chapter. The validity of the comparison is discussed below. He has himself admitted that it is not possible to apply this comparison on the basis of districts. Apart from this, no comparison on a scientific basis between the workers of 1951 and earlier Censuses and the workers of 1961 can be attempted. To my mind, the figures of 1961 have certain inherent defects. Till 1951, a worker should have sufficient income to maintain himself. This has been completely given up in 1961. The large quantum of under-employment has been masked especially in rural areas

by the definition of worker adopted in 1961. Unpaid family workers formed a group for which adjustments have to be made for making the data comparable. In no Census were they meant to be excluded in the category of workers. Till 1921, they were to be included under actual workers. In 1931 they were to be included under working dependents. In 1951 they were to be included either under self-supporting persons or earning dependents according to the share of income attributed to them. But in 1961, the unpaid family workers engaged in productive work were included as workers. It is this category of unpaid family workers who have been treated as workers in 1961, which definition has been properly understood and implemented by enumerators in Madras State, that would account for the incomparably high figures of workers in 1961 Census. When income either in cash or kind was made the basis of classification in 1951, the interpretation put by the enumerator was correct in that every family worker who satisfied this criterion was enumerated. Thus, the somewhat higher figures obtained in 1961 cannot be explained by any operational defect of earlier Censuses.

#### Difficulty due to change in framework of classification

13. Another difficulty for comparison is the framework of classification adopted from Census to Census. Till 1951 no distinction was made between industry and occupation. The economic classification adopted for presenting the data was a combination of industrial and occupational classification. In 1881, 1891 and 1901 Baine's classification based on Dr. Fair's scheme of classification for the Census in Great Britain was followed in which the data were presented under classes, orders, sub-orders and groups. In 1911 data were presented under a new scheme devised by Dr. Jacques Bertillon, a French statistician. It was followed in 1921 and 1931 also. Under both these schemes, the number of classes and groups were modified from time to time. In 1951 the data were presented by dividing the entire population into 8 livelihood classes out of which 4 were agricultural and 4 non-agricultural. The data for non-agricultural classes were further classified into 10 divisions, 88 sub-divisions and

217 groups. This scheme was known as the Indian Census Economic Classification. In 1961 the industrial classification was distinguished from occupational classification. The primary classification in which data were grouped was industrial classification in which workers were divided into 9 industrial categories and non-workers as the

tenth category. Thus it would be seen that no consistent approach has been made in the basis of classification which would not destroy any possibility of comparison. An attempt can, however, be made to correlate the livelihood categories of 1951 to the industrial categories of 1961 on the basis of the statement given below :

<i>Industrial Category</i> <b>1961</b>	<i>Livelihood Class</i> <b>1951</b>
I. Working as cultivators	Livelihood Class I (cultivators of land wholly or mainly owned) plus Class II (cultivators of land wholly or mainly unowned)
II. Working as Agricultural labourers	Livelihood Class III (cultivating labourers)
III. Working in Mining & Quarrying, etc.	Division 0 plus Div. 1 of Livelihood Class V
IV. Working in Household Industry	...
V. Working in Manufacturing other than Household Industry	Div. 2 plus Div. 3 plus Div. 4 of Livelihood Class V plus Sub-division 5.5 of Livelihood Class VIII.
VI. Working in Construction	Sub-div. 5.0 to Sub-div. 5.4 of Livelihood Class V
VII. Working in Trade and Commerce	Livelihood Class VI (Division 6)
VIII. Working in Transport, Storage and Communications	Sub-division 7.0 to 7.4 of Livelihood Class VII plus Sub-div. 7.5 to Sub-div. 7.9 of Livelihood Class VIII.
IX. Working in other services	Livelihood Class VIII minus Sub-div. 5.0 to Sub-div. 5.5 minus Sub-div. 7.5 to Sub-div. 7.9 minus persons in non-agricultural non-productive occupations (i.e. Sub-divisions 5.6, 5.7 and Division 8 and Division 9)
X. Non-workers	<ul style="list-style-type: none"> <li>(i) All non-earning dependents ;</li> <li>(ii) Self-supporting persons whose principal occupation was Class IV with no productive secondary occupation ;</li> <li>(iii) Self-supporting persons with non-productive, non-agricultural occupations included in Class XIII ;</li> <li>(iv) Earning dependents whose own occupation (Secondary means of livelihood) was agricultural rent under Class IV, and</li> <li>(v) Earning dependents estimated at 455,792 whose secondary occupation was non-agricultural non-productive.</li> </ul>

The expression used to describe agricultural classes has also changed from time to time. No distinction was made in earlier Censuses between those who lived on income from agricultural land and those who cultivated themselves. Definitions on ownership and tenancy were not kept uniform. In all Censuses, however, agricultural labourers have been shown as a separate category. In the Censuses of 1901 to 1921, they were denoted as farm servants and field labourers and in other Censuses they were denoted as agricultural labourers. Among non-agricultural classes most of the groups in earlier Censuses were of industrial description and in many cases where the description was of occupational nature, it would be easy to allot them to the appropriate industrial categories as many occupations were associated exclusively with specific industries in India. For instance, firewood gathering would belong to forestry, fishermen to fishing, spinners, potters, basket makers, rice pounders, etc. to the industrial category of manufacturing, brick layers to the category of construction, etc. There are also a few occupational groups which can belong to more than one industrial group which would present greater difficulty for comparison. For instance, cashiers, accountants, carpenters, stenographers, mechanics and messengers can belong to any industrial category. A comparative statement of the groups in various Censuses from 1901 to 1951 which would correspond to the industrial categories of 1961 is appended as an annexure to the Chapter (Annexure 4). In 1951 under the I.C.E.C. scheme, all employers and all independent workers were classified with reference to the commodity produced or service performed by them individually. Employees and all persons engaged in production, commerce and transport were classified with reference to their own activity and without reference to the activity of the employer. All other employees like managerial and supervisory employees, messengers and unskilled labourers were classified with reference to the commodity produced or service rendered by their employers. In 1961, establishment was the unit of classification and the basis of classification was the products made or service rendered by the establishment in

which the individual was working. The self-employed persons were grouped under the classified industry to which their activity relates. In the case of others, they were grouped under the industry in which they were employed. It can thus be seen that there are significant changes in the manner of classification and it is difficult to achieve and obtain point to point correspondence and an absolutely reliable figure for comparison. But it provides scope for certain dimensional comparability from which a coherent picture of the long time trend can be discerned.

### **Increase in workers**

14. The basic question is whether there is any inflation in the number of workers in 1961 Census. If so, is it due to the concept of work and reference period adopted in the Census? Can the quantum of inflation be changed? In Madras State, in 1961, the workers amounted to 15,351,621 in a population of 33,686,953. Out of this, 10,103,326 are males and 5,248,295 are females. The total workers in 1951 numbered 8,755,064 persons. Thus the working force in 1961 shows an absolute increase of 6,596,557 the increase among males amounting to 3,260,775 and females amounting to 3,335,782. The increase among females is much more marked than males. Such a high percentage increase among females has resulted in increasing the sex ratio of female workers from 280 per thousand male workers in 1951 to 519 in 1961. In terms of percentages, in 1961, 45.6% of the population of the State were workers. Among males 59.7% were workers and among females 31.3%. In 1951, the workers accounted for 29.2% of the population, 45.8% among males and 12.7% among females. The participation rate over 1951 has gone up to 56.2% in respect of population, 30.4% in respect of males and 147.00% in respect of females. Only in the three Southern States the female working population has increased by more than 100%, the maximum being in Madras. The following table gives the percentage increase in the number of workers, participation rate in 1961 and percentage increase or decrease in 1961 of participation rate over 1951 in different States,

TABLE XII-3

*Percentage increase in workers in 1961 and participation rate of workers in 1961 in India and States*

States	Percentage increase in working population of 1961 over 1951			Participation rates in 1961			Percentage increase or decrease in participation rate over 1951		
	Persons	Males	Females	Persons	Males	Females	Persons	Males	Females
	2	3	4	5	6	7	8	9	10
1									
Andhra Pradesh	61.8	36.9	124.6	51.87	62.22	41.32	40.61	18.63	95.37
Assam	33.6	32.8	35.2	43.28	54.10	30.91	1.76	0.99	3.10
Bihar	41.9	35.3	57.5	41.40	55.60	27.12	18.42	13.19	31.27
Bombay (Maharashtra & Gujarat)	30.1	26.8	36.0	15.56	55.85	34.59	4.26	1.32	9.43
Kerala	28.7	26.6	34.1	33.31	47.20	19.71	3.22	1.16	7.88
Madhya Pradesh	31.5	24.5	43.1	52.30	60.21	43.99	6.04	-0.31	16.28
Madras	75.5	47.7	175.3	45.57	59.74	31.29	56.17	30.41	141.96

India	33.8	29.0	45.7	42.98	57.12	27.96	9.92	5.37	20.00

It is true that most of the States have recorded increase in participation rate in 1961. It is also true that the all India worker participation rate has also increased from 39.1 in 1951 to 42.9 in 1961 in respect of persons, from 54.1 in 1951 to 57.1 for males and 23.3 to 28.0 for females. This is a reversal of the declining trend in the participation rate observed in the past decades of this

century. But the Southern States of Madras, Andhra Pradesh and Mysore have recorded an abnormal increase. This can be clearly seen from the following Table in which percentage increase in working population in 1961 over 1951 in different States have been arranged in the descending order of proportions.

TABLE XII — 4  
Percentage increase in working population in 1961 over 1951

<i>Persons</i>		<i>Males</i>		<i>Females</i>	
<i>States</i>	<i>Percentage increase</i>	<i>States</i>	<i>Percentage increase</i>	<i>States</i>	<i>Percentage increase</i>
1	2	3	4	5	6
Madras	(75.5)	West Bengal	(81.2)	Madras	( 175.3 )
Mysore	(62.2)	Madras	(47.7)	Andhra Pradesh	( 124.6 )
Andhra Pradesh	(61.8)	Mysore	(43.8)	Mysore	( 114.4 )
Bihar	(41.9)	Andhra Pradesh	(36.9)	Orissa	( 68.0 )
Orissa	(40.0)	Bihar	(35.3)	Bihar	( 57.5 )
Assam	(33.6)	Assam	(32.8)	Madhya Pradesh	( 43.1 )

**The abnormal increase in Southern States**

15. The following table is worked out by

taking the increase in number of workers in India as 100 and distributing it among the States:

TABLE XII — 5

*Distribution of increase in workers in India among different States  
(In terms of percentage)*

State	Persons % of increase	Males % of increase	Females % of increase
1	2	3	4
Andhra Pradesh	14.58	12.26	21.54
Assam	13.51	11.30	17.62
Bihar	12.96	10.90	14.06
Bombay	11.61	10.69	12.09
Kerala	8.41	10.17	11.04
Madhya Pradesh	8.30	7.98	10.40
Madras	5.14	7.15	4.98
Mysore	5.02	6.57	2.74
Orissa	4.48	4.15	2.35
Punjab	3.51	4.00	2.26
Rajasthan	2.64	3.15	0.64
Uttar Pradesh	2.57	2.82	0.15
West Bengal	1.99	2.77	3.94
All India	100.00	100.00	100.00

The abnormal increase found in the Southern States cannot be explained in terms of economic development. It can only be explained on the basis of the change in concept which occurred in 1961 and its practical application in the field. Actually, the participation rates of 1961 are

comparable with those of 1911 and 1921 when the concept of work was almost similar to that of 1961. The following table presents the participation rate for all India excluding Madras, Andhra and Mysore combined and for Madras State separately for the decades of this century.

TABLE XII — 6

*(All India participation rate during the decades compared with that of Southern States)*

Year	All India ratio of workers to total population		Ratio of workers to total population for India excluding Madras, Mysore & Andhra		Madras State ratio of workers to total population		Ratio of workers to total population (Andhra, Madras & Mysore combined)	
	M	F	M	F	M	F	M	F
1	2	3	4	5	6	7	8	9
1911	61.9	33.7	62.6	33.0	...	...	59.5	35.9
1921	60.5	32.7	62.0	32.9	56.9	28.9	55.7	31.9
1931	58.3	27.6	58.9	27.7	56.6	22.5	56.4	31.8
1951	54.1	23.3	55.6	25.3	45.8	12.7	49.0	17.0
1961	57.1	28.0	56.2	25.7	29.7	31.3	60.6	36.3

The above table shows a gradual declining trend in all India rates in 1951 and a reversal of this trend in 1961. Both the decline and reversal are slightly more in the case of females. The rates for India excluding the three Southern States of Madras, Andhra and Mysore present the same picture as that of All India. The rates for the three Southern States as a whole and for Madras State separately also show a declining trend upto 1951 and a reversal of this trend in 1961. But the significant difference lies in that a very steep decline is noticed in 1951 particularly in case of females (31.8 in 1931 to 17.0 in 1951 for the three Southern States as a whole and 22.5 to 12.7 for Madras) and a very steep rise is noticed in 1961 both in case of males and females, very much so in the case of females (17.0 in 1951 to 36.3 in 1961 for the three Southern States and 12.7 to 31.3 for Madras). The obvious conclusion is that the rates of 1961 have an element of inflation consequent on the definition of worker

in 1961. The increase is marked among females. It has brought in a large number of female workers whose contribution to supporting the family has been treated as negligible during 1951 Census. Large participation of females in industries like household industry and cultivation has also given such a high participation rate. The agricultural sector, particularly the cultivators, account for the major portion of the increase in the rates, particularly among female workers. Among female workers, agricultural operations have accounted for more than 70% of the total increase.

#### Increase among Cultivators and Agricultural Labourers from 1951 to 1961

16. the following table presents the percentage increase or decrease of cultivators and agricultural labourers and of population in 1961 over that of 1951.

TABLE XII — 7

*Percentage increase of Population, Cultivators and Agricultural labourers in 1961*

State		Population	Cultivators (I)	Agricultural labourers (II)	Cultivators and Agricultural Labourers (I & II)

	F	21.34	78.20	11.47	51.00

The three Southern States have recorded an abnormal rise among cultivators, particularly among females. Female cultivators are mainly unpaid family workers. As agriculture accounts for the major increase, it can be stated that the factor that has led to this increase is also the

cause for increase in overall participation rate. When the participation rates for rural and urban areas in 1961 are examined separately, it reveals that the rates in rural areas have got exaggerated and this again shows that family worker is the cause for this.

TABLE XII — 8

*Percentage Distribution of Population among Workers in each industrial category for Total/Rural/Urban*

	Workers			Cultivator			Agricultural labourer			Mining			Household Industry		
	P	M	F	P	M	F	P	M	F	P	M	F	P	M	F
	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
T	2.5	4.4	0.6	0.6	1.0	0.2	2.2	3.9	0.6	0.8	1.5	N	7.0	9.3	4.6
R	1.1	1.9	0.3	0.4	0.7	0.1	1.1	1.8	0.5	0.2	0.4	N	6.0	7.5	4.6
U	6.4	11.3	1.3	1.2	2.0	0.3	5.3	9.5	0.9	2.3	4.3	0.1	9.6	14.3	4.8

Among the total female workers engaged in non-household industry, trade, business and profession or service, 3% are family workers. In household industry, nearly 85% are family workers. It therefore follows that the revised definition of work has led to a high increase of

family workers especially in household industry because a housewife who will assist her husband for more than an hour a day has been deemed to be a worker in 1961 Census. Her participation does not actually affect either the income or the output of the household industry. The same

trend will to a limited extent be found among males also. A shift from gainful occupation to that of productive work has perhaps resulted in the inclusion of family workers who are doing work without wages. This contention is supported by the close similarity in the participation rate of women in 1921 when the definition of a worker was similar to the present one. 31.2% of the female population were workers in 1921. The children and women who did any work to augment the family income were also treated as workers. Similar is the position in 1961 when the term worker includes any person doing work without reference to the age provided that work is of more than an hour's duration. To my mind, the definition in 1961 is more elastic than in 1921 because in 1921 a specific addition to the income of the family was needed to justify the inclusion of such persons as workers. The inter-ministry working group set up in 1962 by the Registrar General has come to the conclusion that the concept of 1961 Census basically refers to the same concept as that of 1951, the main difference being the way in which the questions were actually formulated. This view is not, however, supported by the figures of Madras State.

#### Female participation rates of selected States in 1951 and 1961

17. The female participation rates of certain States in 1951 and 1961 are reproduced below:

State	1951	1961
Andhra Pradesh	21.13	41.32
Assam	29.98	39.91
Bihar	20.66	27.12
Gujarat	31.60	27.89
		38.10*
Kerala	18.28	19.71
Mysore	18.08	32.02
Rajasthan	38.24	35.89
Uttar Pradesh	23.63	18.14
West Bengal	11.63	9.43

\* Maharashtra State.

The participation rate has shown some variation which is more pronounced in Madras and other Southern States. One of the reasons

for this variation in participation rate can be the prevalence of large number of household industries in the Southern States of Madras, Andhra Pradesh and Mysore than in other parts of the country. It is not possible to work out separately the amount of increase in household industry since the number of workers in household industry cannot be estimated from 1951 Census. But substantial portion of the increase can be attributed to those engaged in household industry. The total workers in household industry in 1961 is 1½ times more than the workers in manufacturing and female workers in household industry in 1961 and even five times more than those engaged in manufacturing. I have given below a statement indicating the participation rate of women in household industry.

State	Household industry
Assam	4.55
Andhra Pradesh	3.74
Kerala	3.51
Jammu & Kashmir	3.16
Madras	3.13
Orissa	2.79
Mysore	2.22
Gujarat	2.12
Rajasthan	2.09
Madhya Pradesh	1.97
Bihar	1.96
Maharashtra	1.42
Uttar Pradesh	1.37
Punjab	1.28
West Bengal	1.15

#### Unpaid Family Worker

18. The role of unpaid worker has made comparison difficult between the figures of 1951 and 1961. The unpaid family worker is basically a worker. All international bodies have accepted this. It is, however, difficult to say what 'economically active work' is. In a subsistence economy like ours, the contribution by unpaid family workers to work is quite significant, but cannot be quantitatively defined. Even petty activities like making cowdung

cake or collecting grass or fuel, and looking after cattle during leisure would be treated as work under the criterion adopted in 1961 Census. But particularly women in rural areas render more assistance in agriculture or household industry which is the main economically productive work in rural areas. It is only in the urban areas and that too among the middle class and higher strata housewives have the luxury of leisure and are free from participation in any economically productive work. The rural population form more than 80% of the population. The high proportion of family workers in rural areas brings into clear light the fact that females in rural areas toil and labour equally as hard as men, if not more. It may, therefore, not be proper to omit unpaid worker from the economically active population. The U. N. standard of a minimum regular work is one third of the usual working time per day which is normally about 3 hours assuming that 8 hours constitute the usual working time. Hence, from the standpoint of international standards, it may be felt that there has been over-enumeration in 1961. It can, however, be argued that emphasis has been laid on regularity and a minimum of one hour of regular work is in effect a regular and substantial participation in the production of goods and services. It has been suggested that the adoption of the reference period in place of usual status might be a factor for increased participation rate in 1961. This may not have given rise to any significant addition even in the case of seasonal workers as a person engaged in agricultural activities over the greater part of the season would be covered under "usual status" also and one engaged over a greater part of the agricultural year would also naturally be recorded under the reference period.

#### Other reasons for increase in workers

19. Some feel the inclusion of the element of supervision and direction of work on par with actual work would have contributed to inflation of figures. This is not a new approach. Even in 1951 the man who takes the responsibility for the direction of the process of cultivation was treated as a cultivator. In U.S.A. in Censuses upto 1930 they traditionally obtained the count of gainful workers based on usual status. From 1940 the

labour force approach based on reference period was adopted. But despite the difference in concept the participation rates in U.S.A. remained almost constant during the decades. The following statement shows this.

Labour participation rate in U. S. A.

1910 to 1950

Years	Participation Rate
1910	39.4
1920	39.4
1930	39.8
1940	40.1
1950	39.7

But what is true in a highly developed country need not apply to a backward economy like ours. At this stage, it may be relevant to examine whether any group of non-working population is likely to be included as workers. It is possible that a full time student attending school and housewife in rural areas who would have rendered minor help in economically productive work would be treated as worker. Such cases, it is hoped, would be few. Instances of male workers who ought to have been included under workers but wrongly included as non-workers have been recorded. In Madras State, 42,646 males have been recorded under the group of household duty which is one of the 8 categories of non-workers. The figures thus recorded in rural areas are more than 3 times than those in urban areas. Most of the males recorded under this group in rural areas are of the age group 0-14, and they may be children who neither attend school nor assist their parents in field work and they have to be treated only as non-workers. But in urban areas, the figures recorded are almost equal in all age groups. In this State, it is customary to call the hired male worker attached to the household who helps in work at home and at field as 'Pannaial' in rural areas and in urban areas they are known as 'Veetu Velaiyal' and their work as 'Veetu Velai.' It is probable that such persons who should have been treated as workers might have been included as non-workers. In the definition of household duties no sex has been mentioned, It only states

that any person engaged in unpaid household work should be recorded under this group.

The participation rates of India and Madras agree in general with the participation rates observed for agricultural countries.

*Average crude activity rates in countries classified according to degree of Industrialisation*

*(Percentage of economically active among population of all ages of each sex)*

Degree of Industrialization	Both sexes	Males	Females
1. Industrialized countries (21 countries having less than 35 per cent of active males engaged in agriculture and related activities)	42.9	62.2	24.3
2. Semi-industrialized countries (30 countries having 35 to 59 per cent of active males engaged in agriculture and related activities)	39.5	57.8	21.2
3. Agricultural countries (21 countries having 60 per cent or more of active females engaged in agriculture and related activities)	40.3	55.2	25.4

The U. N. Handbook of Population Census Method has also indicated that it is much more difficult to measure female participation rate for various reasons. In conclusion, it may be said that increase in participation rate is mainly conceptual in the sense that family work has been included. Though there appears to be an element of over-enumeration in 1961, it should be understood that the role of the family worker is significant and omitting to consider them as economically active will be unrealistic. In short, 1961 Census has made many changes, innovations and departures from the conventional path in the field of economic data and has achieved refinement in concepts and sharpness of tools of measurement but has brought forth new problems of comparability. Let me hope that in 1971 Census no abrupt departure from the current approach will be made so that some sort of comparability can be maintained.

**Occupational classes and orders adopted during decades**

20. The following table will give the number of occupational classes and orders adopted from 1881 to 1961.

TABLE XII — 9

*Occupational classes, orders, etc., adopted in Censuses from 1881 to 1961*

Year	Classes	Orders	Sub-orders	Groups
1881	6	18	81	459
1891	7	24	77	465
1901	8	24	79	520
Sub-class				
1911	4	12	55	169
1921	4	12	56	191
1931	4	12	55	195
Division Sub-division				
1951*	8	10	88	217
Division Groups Families				
1961	11	75	331	

Note: \* 1951 classification is more an industrial classification than occupational.

Out of 8 livelihood classes only 4 classes (non-agricultural) were further subdivided into divisions, sub-divisions and groups.

As indicated earlier, the classification adopted in 1961 has departed completely from those in earlier Censuses. It is based on the scheme known as the Indian Standard Industrial Classification. It is closely related to the International Standard Industrial Classification. According to this system, there are nine Divisions, each Division divided into a number of Major Groups not exceeding 10 which in total number 45. Each Major Group is again sub-divided into Minor Groups not exceeding 10 which totals to 343. Three digit code numbers, the first representing the Division, the second the Major Group and the third the Minor Group have been devised and each industry has thus been codified. The code system known as the Digit system is closely related to international usage as recommended by the International Labour Organisation. As already mentioned, the main unit of classification for tabulation itself has been based on the National Classification of Occupation with a code structure which classifies various occupations into occupational Divisions, Groups and Families. The

classification has been made taking the basic task involved in each occupation into consideration. In this three digit code system, the Division is represented by the first digit of the code number, the occupational Group by the second digit and the occupational Family by the third digit. There are 11 occupational Divisions, 75 occupational Groups and 331 occupational Families. This system based on the International Standard

Classification of Occupations modified to suit Indian conditions was approved in 1958 by a working group represented by the major users of occupational data in India. Thus the present classification is quite different from what has been followed in the past in presenting the occupational data. A statement showing the names of occupational Classes and Divisions in Censuses from 1881 to 1961 is presented below.

TABLE XII — 10

*Occupational Classes and Divisions in Censuses from 1881 to 1961*

Classes 1881	Classes 1891	Classes 1901
A Professionals	A Government	A Government
B Domestic	B Pasture and Agriculture	B Pasture and Agriculture
C Commercial	C Personal Services	C Personal Services

**TABLE XII — 10 (Contd.)**  
*Occupational Classes and Divisions in Censuses from 1881 to 1961*

<b>Divisions</b>	<b>1951</b>	<b>Divisions</b>	<b>1961</b>
0	Primary Industries not elsewhere specified	0	Professional, Technical and related workers
1	Mining and Quarrying	1	Administrative, Executive and Managerial workers
2	Processing and manufacture — Food-stuffs, textiles, leather and products thereof	2	Clerical and related workers
3	Processing and manufacture — Metals, chemicals and products thereof	3	Sales workers
4	Processing and manufacture not elsewhere specified	4	Farmers, Fishermen, Hunters, Loggers and related workers
5	Construction and utilities	5	Miners, Quarrymen and related workers
6	Commerce	6	Workers in Transport and Communication occupations
7	Transport, Storage and Communications	7-8	Craftsmen, Production Process workers, and Labourers not elsewhere classified
8	Health, Education and Public Administration	9	Service, Sport and Recreation workers.
9	Services not elsewhere specified	10	Workers not classifiable by occupation

#### **Status of worker**

21. For an appropriate analysis of the economically active population, it is necessary not only to distinguish the industry and occupation but also the status of worker. By status of worker, it is meant the class of worker, i.e., whether he is an employer or employee or own account worker or family worker. The U. N. has also recommended status classification as one of the basic classifications to be done in the Censuses of the countries.

In the Censuses upto 1941, no question was put regarding the status or class of worker. In 1951, a question on the economic status of an individual was asked and in that the enumerator was asked to denote whether a self-supporting person earned his principal means of livelihood as an

employer or as an employee. Upto 1921 the 'actual workers' conceptually comprised of employers, employees, single workers and family workers but they were not tabulated separately. In 1931, unpaid family workers were enumerated separately as working dependents. In 1941 Census, a question was asked as to whether the Person employed paid assistants or members of the household and if so, to indicate the number employed. In 1951, only self-supporting persons were classified according to their status as employers, employees and independent workers. In 1961 Census, in the case of cultivators (Q. 8) status as employer, employee, single worker or family worker was not asked in Individual Slip. But in household schedule a question was asked about head of household, family worker and hired

worker in cultivation. In the case of agricultural labour (Q.9) no status was asked. The assumption was that all would be employees. In the case of household industry (Q.10) it was asked whether the person is an employee or not, the implication being that if a person was not an employee, his further classification in this section into single worker or family worker would be unnecessary. The further implication was that within the household, so far as a household industry was concerned, there was no question of anyone being earmarked as an employer because the industry belonged to the household and not to any particular person in the household. In the household schedule, however, the head of the household, the family worker and the hired worker has been severally spelt out. The status of employee or family worker in Q.10 could naturally be either in it as principal or secondary work.

In the case of non-household industry, (Q.11) a person could be either employer, employee, single worker or family worker and this could be his status in either his principal or secondary work. The employer is a person who has to employ other persons in order to perform the work entered in Q.11 (a). That is to say, such a person is not only responsible for his own personal work but also for giving work to others in the business mentioned in Q.11 (a). But a person who employs domestic servants for household duties or has subordinates under him in an office where he is employed by others is not an employer even if he has the power to employ another person in his office on behalf of his own employer or employers.

(ii) An Employee is a person who usually works under some other person for salary or wages in cash or kind. There may be persons who are employed as Managers, Superintendents, Agents, etc., and in that capacity employ or control other workers on behalf of their own employers. Such persons are only employees, as explained above, and should not be regarded as employers.

(iii) A Single Worker for the purpose of Q.11 (c) is a person who works by himself but not as Head of Household in a Household Industry. He is not employed by any one else and in his turn does not employ anybody else, not even members of his household except casually.

This definition of a Single Worker will include a person who works in joint partnership with one or several persons hiring no employees, and also a member of a producers' co-operative. Each one of the partners or members of such producers' co-operatives should be recorded as 'Single Worker'. U. N. recommends a separate group for members of producers' co-operatives.

(iv) A Family Worker is a member who works, without receiving wages in cash or kind, in an industry, business or trade conducted mainly by members of the family and ordinarily does at least one hour of work every day during the working season. For the purpose of the entire Q. 11, such an industry should be on a scale larger than what has been covered in Household Industry in Q. 10 whether run at home or away from home in town or village and should ordinarily be in the nature of a recognised partnership, joint stock company or registered factory. For the purpose of this definition members of a family may be drawn from beyond the limits of the household by ties of blood or marriage. The family worker may not be entitled to a share of the profits in the work of the business carried on either by the person or head of the household or other relative.

Members of the household who help solely in household duties should not be treated as family workers.

### Secondary Occupation

22. In the Censuses of 1881 and 1891 no secondary occupation was recorded. Occupation from which income was chiefly derived was considered as the chief occupation. In the case of persons who combined agriculture with any other profession the other professions were recorded. Upto 1931, the same procedure was adopted. In 1941, various means of livelihood in the order in which they contributed to the livelihood of a person were recorded against the question 'Means of livelihood'. In 1951, the term 'Subsidiary occupation' was changed into 'Secondary means of livelihood'. In the case of persons having subsidiary means of livelihood particulars as to whether the subsidiary work was exercised throughout the year and if not, the portion of the year in which the subsidiary means of livelihood was exercised was also recorded. However, the change made in 1951 in

the term involved no change in concept. In 1961, the concept of principal work changed with emphasis on work. The work on which a person spent most of his working time was considered as the principal work irrespective of the income derived from it. Specific columns in the individual slip for recording cultivators, agricultural labourers, persons working in household industry and other workers engaged in sectors other than those mentioned above were provided. If two entries were found in the answers to these questions, the enumerator found out the principal work and marked the question against which the principal work had been recorded with a ring around the question number. In the case of more than two entries, the other work next in importance was ascertained and marked with a tick mark on the right hand side of the proper question number. The importance of subsidiary work among other subsidiary work was decided on the basis of the time spent in that work. It was not the original intention of Census authorities that the principal work should be distinguished from subsidiary work. The position of principal and subsidiary work as a cross tabulation of all four types of work would indicate the extent of traditionalism, modernisation and specialisation. It would also indicate the inadequacy of work in primary employment. Moreover, the categories of workers are not mutually exhaustive. It is likely that the person may be having work in more than one industrial category of work with the result that the preparation of tables on the basis of only one productive work will give a somewhat unreal picture. Only Table B-VII provides the data on secondary occupation. The other Tables have been prepared on the basis of principal work.

#### **Difficulties encountered in collecting the data**

23. Before analysing the data, the difficulties encountered in collecting the data can be discussed. It was easier to understand the concept of worker in 1961. Only consideration was whether he did any work. No test was applied as to whether he was self-sufficient, whether his income was adequate to support him and whether he was the principal earning member of the family. The consideration that credit for the maintenance of the family should be given to the head of the

household whatever his income be is a relative consideration among Indians. The error caused by this has been eliminated. In any seasonal occupation like agriculture and household industry a person to be considered as a worker had to work for more than an hour. It may appear a simple process to do so. But enumeration has been rendered difficult by the originality of the definition adopted for household industry and household cultivation. These two concepts are a little difficult to follow. In household cultivation, persons doing cultivation at some distance were excluded without specifying what that distance was. The concept of household cultivation would vary from place to place. In household industry, an artificial distinction was made between the rural and urban areas. Again, a certain part of the household industry could be conducted at home and certain other parts outside. In some of the industries practised in the State, it was difficult for an enumerator to determine whether a particular industry has to be treated as a household industry or not. To give one instance, handloom can be a household industry depending on the importance given to the particular operation, whether it was for spinning or twisting. The concept will therefore depend to some extent on the approach made by each enumerator. The household industry was conditioned by three basic factors: (1) participation of all members of the household (2) location (3) production, servicing or manufacturing. Sometimes they will be mutually contradictory. It can quite happen that an industry in which members of the household participate will be located outside the household and will cease to qualify as a household industry. Some confusion existed among the enumerators between manufacturing, servicing and production. There was a tendency to include 'Iddlies' making as manufacture. Sometimes they thought that any production in a household would constitute an household industry. Some of these entries were actually eliminated in the Tabulation Offices. Though it would be true to say that the basic concept of the division of population into worker and non-worker is sound, in its practical application to household industry and household cultivation, considerable difficulty was experienced in putting across the concept to the enumerators and to the general population.

## Part — B — Sectoral Classification of Workers

**Distribution of population in Industrial Categories in India and States**

24. Table 11 presents the distribution of persons in India and in each State by industrial categories. 29.9% of the population are workers in agricultural sector. Among other categories, the maximum proportion is found in other services (4.5%). Household industry, manufacturing other than household industry, trade and commerce and mining are the other categories each of which account for 1 to 3% of the population. The proportion in construction (0.5%) and transport (0.7%) is insignificant. This is the pattern not only for the Country, but for all States except Kerala. In Kerala, other services account for the highest proportion (8.4%) and the other categories in the order are cultiva-

tion, agricultural labourer, manufacturing, household industry, mining, trade and commerce and construction. The proportion in each of the category of workers exceeds that of the corresponding All India proportion. Among the States, in the category of cultivators, the proportion to population is highest in Rajasthan (35%), in the category of agricultural labourers highest in Andhra (14.8%), in mining and quarrying the highest is in Assam (4.4%), in the category of household industry in Andhra (5.1%), in manufacturing in West Bengal (3.8%), in construction in Mysore (0.8%), in transport in West Bengal (1.1%) and Maharashtra (1.1%) and in other services in Kerala (8.4%). There is considerable variation in the participation rate of men and women.

The general pattern, however, is the same. Except in the category of cultivators in all other categories of workers, the proportions of both males and females in this State are higher than the corresponding All India proportions. In the

category of household industry, the proportion is higher among females in the States of Assam (males 0.4%, females 4.6%), Jammu & Kashmir (males 2.3%, females 3.2%) and Kerala (males 2.2%, females 3.5%). In the categories of

both construction and transport in the States of Assam, Bihar, Orissa, Uttar Pradesh and West Bengal the proportion of female workers is negligible. Apart from this, in the category of construction in Jammu & Kashmir and Kerala and in the category of transport in Andhra, Gujarat, Madhya Pradesh, Mysore, Punjab and Rajasthan, the proportion of female workers is less than 0.1%. The percentage of females at work is very high in the States of Andhra (41.3%), Assam (30.9%), Madhya Pradesh (44.0%), Madras (31.3%) Maharashtra (38.1%), Mysore (32.0%) and Rajasthan (35.9%). Low percentages are found in the States of West Bengal, Punjab, Uttar Pradesh and Kerala. Presentation of the above

Table in another form grouping the industrial categories as primary, secondary and tertiary sectors will help us to examine whether there is any regional pattern in differential ratio of women at work. Under the primary sector, categories of cultivation and agricultural labourer (I & II) and livestock, forestry, fishing, hunting and plantations, orchards and allied activities Division 0 (Category III Mining and quarrying) are included. Mining and quarrying, household industry (category IV) and manufacturing other than household industry (category V), construction (category VI) and other services (category IX) are treated as secondary sector and the rest as tertiary.

**Relative strength of workers in Primary, Secondary & Tertiary sectors in India and States**

25. Primary sector, particularly the agricultural sector is the one in which both among male and female population high proportions of workers are found. Tertiary sector comes second in importance. Only in the State of Kerala the primary sector comes second, the tertiary sector accounting for the larger proportion of male population. Only in Assam in category III of primary sector the proportion of women at work is considerable being 41 out of 1,000. In all other States it is less than 10 out of 1,000. The male proportion also in this category III of primary sector is high in Assam and Kerala. The percentage of females in the agricultural sector is the highest in Madhya Pradesh and least in West Bengal. The percentage of female population in the agricultural sector of the primary sector

exceeds the national average of 22% in the States of Bihar, Gujarat, Andhra, Madhya Pradesh, Maharashtra, Mysore and Rajasthan. In the secondary sector, only in Assam, the percentage of female population exceeds that of male workers. In the tertiary sector in the States of Madras, Kerala, Orissa, Andhra Pradesh and Mysore, the proportion of female workers exceeds that of the national average. In this, the Southern States present a uniform pattern. The social and economic conditions of these States can be said to be factors favouring the participation of females in the tertiary sector.

**Relative strength of Primary, Secondary and Tertiary sectors in the districts of Madras State**

26. The variation in these proportions among the districts of Madras State may now be examined.

TABLE XII — 14

	M	181	45	102		197	475
	F	27	3	104		42	824

N denotes Negligible

Except in Madras City and Kanyakumari, the proportion in all other districts in the agricultural sector of the primary sector is the highest. The tertiary sector accounts for the next highest among total population and males. In respect of females too, in all districts except Ramanathapuram and Tirunelveli the tertiary sector ranks second and only in the case of these exceptions the secondary sector ranks second. These two are the southern-most districts of the State. In Kanyakumari district alone tertiary sector accounts for the highest proportion, the secondary next higher proportion and the primary the last. Among the proportions in livestock,

forestry, etc. (category III except mining) in the primary sector, high percentage of 13.5 is recorded in Nilgiri district chiefly owing to the existence of the vast number of plantations.

#### Classification of the districts according to the relative strength of workers in the three sectors

27. The above table has been recast below so as to present the districts within 100 and 250 points or more either way in respect of State average in the primary sector and other columns have been presented to give a comparative picture.

TABLE XII — 15

*Districts arranged according as they are within 100, 250 or more points  
either way of the State figure in the Primary Sector (I & II) only, 1961*

Primary Sector								
(I & II)				III				
More than 25% above State average	10% to 25% above State average	10% +/- of the State average	Less than 10% -25% below State average	More than 25% below State average	"O" Division only	Secondary sector IV to VI including col. III Div. I and col. IX Div. 5	Tertiary sector VII to IX	Non- workers
1	2	3	4	5	6	7	8	9
South Arcot (358)	...	...	...	...	6	33	61	542
Salem (347)	...	...	...	...	5	79	82	487
Tiruchirapalli (351)	...	...	...	...	6	54	82	507
North Arcot (320)		...	...	...	6	59	82	533
Ramanathapuram (324)		..	...	...	9	64	83	520
	Chingleput (263)		...	...	11	72	88	566
	Madurai (269)		...	...	13	55	118	545
	Thanjavur (290)		...	...	10	38	82	580
		Coimbatore (222)		...	17	108	134	519
		Tirunelveli (234)		...	16	105	101	544
			Nilgiri (137)		135	62	125	541
			Kanyakumari (105)		24	103	120	648

Among the 12 districts of the State, three, viz. South Arcot, Salem and Trichy have proportions more than 25% above the State average in the agricultural sector and three other districts viz., Chingleput, Madurai and Thanjavur are in the group of 10% plus or minus of the State average. In South Arcot, Salem and Trichy, the economy is less diversified. Particularly, South Arcot is a backward area. The lowest proportion in agricultural sector in Nilgiri is accounted for by the very high proportion in plantations and that of Kanyakumari by the high proportion of tertiary sector. As the level of literacy is very high in Kanyakumari as compared to all other districts of the State, the tertiary and secondary sector accounts for more proportion than the primary sector.

In the table below, the districts are arranged in descending order of participation of workers per 1,000 population in category III in the secondary and tertiary sectors and also for non-workers. Coimbatore, Tirunelveli and Kanyakumari account for the first three ranks in the secondary sector each having more than 100 persons per 1,000 population in this sector. Coimbatore is an industrial centre and in Tirunelveli and Kanya-

kumari household industries are predominant. Madras is a commercial centre where lots of firms are situated and hence it has more than 200 persons per 1,000 population in the tertiary sector. In the agricultural sector, similarity in proportion is found in South Arcot and Salem which are geographically contiguous. Both have proportions more than 25% above the State average. In respect of category III of primary sector, geographical contiguity is seen for North Arcot and Salem which have low proportions compared to the State average. In the case of secondary sector, Tirunelveli and Kanyakumari, the two adjoining districts show similarity in pattern. Similarity of characteristics is also found in the geographically contiguous areas of Madurai and Trichy which have proportion amounting to lower than 20% of the State average and South Arcot and Thanjavur amounting to less than 25% of the State average. In the tertiary sector, Coimbatore and Nilgiri have proportions amounting to more than 25% of State average and they are geographically contiguous. Salem, Trichy and Thanjavur have same proportions which are about 15% less than the State average and form another geographically contiguous area.

TABLE XII — 16

*Districts arranged in descending order of participation of workers per 1,000 of population in category III and the Secondary and Tertiary Sectors and Non-workers, 1961*

Category III	No. per 1,000	Secondary Sector		Tertiary Sector		Non-workers	
		District	No. per 1,000	District	No. per 1,000	District	No. per 1,000
<b>State average</b>	<b>12</b>	<b>State average</b>	<b>69</b>	<b>State average</b>	<b>99</b>	<b>State average</b>	<b>544</b>
1. Nilgiri	137	Coimbatore	108	Madras	203	Madras	695
2. Kanyakumari	27	Tirunelveli	105	Coimbatore	134	Kanyakumari	648
3. Coimbatore	18	Kanyakumari	103	Nilgiri	125	Thanjavur	580
4. Tirunelveli	17	Madras	98	Kanyakumari	120	Chingleput	566

6. Chingleput	12	Chingleput	72	Tirunelveli	101	Tirunelveli	544

TABLE XII—16 (Contd.)

*Districts arranged in descending order of participation of workers per 1,000 of population in Category III and the Secondary and Tertiary Sectors and Non-workers, 1961*

Category III	No. per 1,000	Secondary Sector		Tertiary Sector		Non-workers	
		District	No. per 1,000	District	No. per 1,000	District	No. per 1,000
7. Thanjavur	11	Ramanathapuram	64	Chingleput	88	South Arcot	542
8. Ramanathapuram	9	Nilgiri	62	Ramanathapuram	83	Nilgiri	541
9. South Arcot	9	North Arcot	59	Salem	82	North Arcot	533
10. Tiruchirapalli	8	Madurai	55	Tiruchirapalli	82	Ramanathapuram	520
11. North Arcot	7	Tiruchirapalli	54	Thanjavur	82	Coimbatore	519
12. Salem	7	Thanjavur	38	North Arcot	82	Tiruchirapalli	507
13. Madras	4	South Arcot	33	South Arcot	61	Salem	487

**Analysis of contiguous areas having similar characteristics in variation from that of State**

28. For those districts which form a contiguous geographical area and which show

variations of more than 25% or less than 25% of the State average, further analysis has been made in the following table.

TABLE XII — 17

*Distribution of taluks of districts which show similarity of characteristics and geographical contiguity in Primary Sector*

Districts	Taluks in descending order of workers' participation per 1,000 of total population	Primary Sector	
		I & II No. per 1,000	III No. per 1,000
South Arcot	1. Kallakurichi	430	8
	2. Gingee	440	5
	3. Vriddhachalam	419	13
	4. Tirukkoyilur	389	7
	5. Tindivanan	365	9
	6. Villupuram	324	5
	7. Cuddalore	263	14
	8. Chidambaram	304	4
Salem	1. Yercaud	278	204
	2. Tiruchengode	317	5
	3. Rasipuram	273	3
	4. Sankari	365	4
	5. Namakkal	393	3
	6. Krishnagiri	442	5
	7. Harur	152	3
	8. Dharmapuri	430	7
	9. Attur	400	9
	10. Hosur	426	4
	11. Omalur	295	16
	12. Salem	161	6

In the case of South Arcot district, all taluks other than Cuddalore show proportions in the agricultural sector almost similar to the district average. But a low proportion has been recorded in Cuddalore taluk which is natural as it is the headquarters of the district. Similar is the case with Salem, Salem taluk recording lower figures. Krishnagiri and Harur which are geographically contiguous taluks have shown proportions amounting to more than 25% of the State average.

TABLE XII — 18

*Distribution of taluks of districts which show similarity of characteristics and geographical contiguity in Secondary Sector*

Districts	Taluks in descending order of workers' participation per 1,000 of total population	Secondary Sector (IV, V & VI) No per 1,000
1	2	3
Tirunelveli	1. Sankaranayinar Koil	85
	2. Kovilpatti	80
	3. Tenkasi	117
	4. Ambasamudram	165
	5. Shencottah	75
	6. Nanguneri	87
	7. Tirunelveli	114
	8. Srivaikuntam	86
	9. Tiruchendur	110
Kanyakumari	1. Thovala	39
	2. Agasteeswaram	122
	3. Vilavancode	112
	4. Kalkulam	83

In the case of Tirunelveli district which has more than 25% above the State average in the secondary sector, Ambasamudram taluk alone presents a variation of more than 25% and Shencottah a proportion lesser than 25%. In

Kanyakumari district which also has more than 25% above the State average in the secondary sector, the taluk of Thovala shows a variation of over 25% lesser than the district average.

TABLE XII — 19

*Distribution of taluks of districts which show similarity of characteristics and geographical contiguity in Tertiary Sector*

Districts	Taluks in descending order of workers' participation per 1,000 of total population	Tertiary Sector (VII, VIII & IX) No. per 1,000
Coimbatore	1. Dharapuram	135
	2. Erode	115
	3. Bhavani	129
	4. Gopichettipalayam	137
	5. Udumalpet	154
	6. Palladam	116
	7. Pollachi	147
	8. Avanashi	127
	9. Coimbatore	151
Nilgiri	1. Gudalur	91
	2. Ootacamund	182
	3. Coonoor	147

In Coimbatore district which has more than 25% above the State average in tertiary sector, none of the taluks show any variation. This reflects the even state of development in the district. In Nilgiri district which has also greater proportion than 25%, out of the three taluks, two present a divergent picture from that of the district. Ootacamund taluk has proportion amounting to more than 25% than the district average. Ootacamund is a tourist centre and administrative headquarters of the district. Gudalur has a proportion which is lower by more than 25% of the district average which corresponds to the State average.

### Primary sector

29. In 4 out of 12 districts, the participation rates of men are 10 to 25% above the State average. In South Arcot, participation rate is more than 25% of the State average, while Trichy, Salem and Ramnad record more than 25% of State average for women. For six districts — North Arcot, Madurai, Tirunelveli, Coimbatore, Kanyakumari and Nilgiri the participation rates of men are in the same range as those of women. No similarity is however found in the regional crop pattern in these districts. The participation rate of men for category III falls in the range of

more than 25% below State average for 5 districts. But for women this is found in 9 districts. While in Nilgiri both the proportions of men and women in category III are above the State average by more than 25%, in the case of Tirunelveli and Kanyakumari, the rate for men is more than 25% above the State average. The corresponding rate for women is at the other extreme being more than 25% below State average. Coimbatore and Madurai have proportions more than 25% above the State average for women. The corresponding rate of men falls within the range of 10 to 25%, above State average in Coimbatore

### **Secondary sector**

30. In the secondary sector, Madras and Coimbatore record the highest men participation rate. The women participation rate is lowest in Madras in the range of 25% below the State average. The participation rate of women in Coimbatore is also high being 25% above State average. In Tanjore and South Arcot, both the participation rates of men and women are below the State average by more than 25%. In Salem, Kanyakumari, Tirunelveli and Ramnad, participation of women in secondary sector is higher than that of men.

### **Tertiary sector**

31. In the tertiary sector, men participation rate is the highest in Madras, Kanyakumari and Nilgiri, being more than 25% above State average. In the districts of Coimbatore and Madurai, the rates of women are highest being more than 25% above State average. In Tirunelveli, Ramnad, Trichy and South Arcot, the ranges in which the participation rates of men and women fall are the same. It would be seen that there is a definite relationship between the rates of men and women in many districts. The participation rates of women are highest in the

primary sector in the districts of Trichy, Salem and Ramnad. No marked similarity is however found in the pattern of cultivation. In the secondary sector, Kanyakumari, Tirunelveli, Coimbatore and Ramnad record the highest participation rate for women. In these districts, household industries provide sufficient scope of employment for women. In Kanyakumari, fish net making is a household industry found almost in every home. In Tirunelveli district, beedi and cigar making is an important industry giving wide scope for employment of women. Cotton spinning is done on the scale of household industry and cotton spinning and oil ginning in mills account for the high participation of women in this sector in Coimbatore district. Making of matches is a common household industry conducted in many of the households in Ramnad and this accounts for the high participation rate of women in this sector. The participation rate of women in tertiary sector is high in Coimbatore and Madurai districts. Madras records the highest rate of non-workers for women. As Madras is entirely urban, the scope for family workers is negligible. While no district records more than 25% lower than the State average, proportions in 9 out of 13 districts fall within the range of below 10% variation on either side of the State average.

**Non-working females**

32. It can be seen from Table 21 that among the female non-workers, half of them (50.8%) are children belonging to the age-group 0-14 and more than 40% belong to the working age-group (27% in 15-34 age-group and 16% in 35-59 age group). Among the non-working females of the working age-group, viz., 15-59, 92% are housewives. Detailed analysis of non-workers will be found in the next chapter.

**Workers in working age-group and non-working age-group**

33. Normally 0-14 age-group and 60+ are

treated as economically inactive. The age-group 15-59 is therefore the normal working age-group. But in practice, many persons in the age-groups of 0-14 and 60+ are by necessity compelled to work. Further, persons who are seeking work are not included in the working force. If they had adequate opportunity, they would have also become workers. There are also many in the working age-group who are neither economically active nor looking for work. They would also become workers if there had been a fuller utilisation of our manpower resources. Taking into consideration these factors, the following table is presented.

Note: Age not stated is omitted.

While 129,966 males are not in the working force because of lack of work, 590,803 males of 0-14 age-group who should be normally school going children are found to be workers. This tendency is more pronounced in rural areas. 515,142 males of 0-14 age-group are workers in rural areas. At the same time, the number of males seeking employment, i.e. males who are not workers due to lack of opportunities are only

37,014 in the rural areas compared to 92,952 in urban areas. As agriculture provides scope for a lot of under-employment, the number of persons not having any work is less in rural areas. It is also seen that among females 424,014 of 0-14 age-group are in the working force. More than 75% of them are found in the rural areas. The economic set-up, particularly in the rural areas promotes the participation of women in work.

Working Population

**Expected role of youngsters**

34. Normally 5-14 age-group should be considered as the population of school going age. Since the children of today would be the adult citizens of tomorrow, education is of paramount necessity in order to shape the destiny of the country. The trend to consider age upto 14 years as school going age is clearly found in the directive principles of State Policy enshrined in the Indian Constitution. Article 45 states: "The State shall endeavour to provide within a period of ten years from the commencement of this constitution for free and compulsory education for all children until they complete the age of fourteen years". Article 39 (e) states that it should be ensured that the tender age of children is not abused and that citizens are not forced by economic necessity to enter avocations unsuited to their age or strength. The discussion in this chapter will show that both these principles have not been fulfilled properly in Madras State. It is interesting to know that the Royal Commission on Population in Great Britain (1949) is of the view that the provision of compulsory school going for 0-14 age at the end of last century acted as a great fillip to family limitation. It states as follows.

"In the old domestic handicrafts and in cottage agriculture, women and children joined in the income earning activities of the household. Children worked at home from very early ages, often as low as 4 to 6 years. As the domestic handicrafts and cottage agriculture decayed, work at home was superseded by factory wage labour and the family gradually ceased to be an economic unit. Children could no longer share in the economic activities of their parents. In the conditions created by the Industrial Revolution, the employment of children in factories and mines as wage-earners subsidiary to their parents was indeed common in the first half of the 19th century. But this practice was repulsive to humanitarian sentiment and with the passing of successive Factory Acts, very young children ceased to be earners. At the same time, elementary education was developing, a movement that was carried a great step forward by the Education Act of 1870. By the fourth quarter of the 19th century children had to be fully maintained by their parents at least upto the age of 10 years which

must for many have been more than twice as long as in the days when children helped in the work of the household from their very early years.

This change must have altered momentarily the ordinary man's thinking about having children. Whereas in the old days children brought income in cash or kind to the household comparatively soon to offset the cost of their upkeep, they had now become in the economic sense an unrelieved expense. The contrast between a man who had only his wife and himself to maintain and his neighbour with, say, six children could not but be conspicuous. As the amount a man spends on his children is related to his own standard of living, this contrast must have been very striking in nearly all classes of the community not only among the poor. The contrast would be conspicuous among those who would have to sacrifice "luxuries" to support their children as well as among those who had to suffer want. Moreover, in the Victorian age the maintenance or improvement of one's standard of living became an important object and ever present problem to larger and larger sections of the community".

It will be, therefore, in our interest to make school going compulsory. In a developed country where majority of workers are in organised sectors of employment, minimum and maximum age limits are prescribed and adhered to. But in a developing economy like ours where agriculture is the chief source of occupation, participation in economically productive work is affected less by age and hence many children will have to work and many old persons will continue to work. Normally, the dependency proportion is worked out as the number of persons in the dependent ages of 0-14 and 60 and over per 100 persons in the working ages. Dependency ratio thus works out to 76.1% in Madras compared to 85.9% in India. The low proportion in Madras will be due to the high participation rate of women in this State. The declining mortality and the constant fertility will increase the dependency burden. The level of mortality in this State during the decade 1951-60 has been 23.7 per 1,000 as against the birth rate of 34.9. Today the 0-14 population constitutes 37.7% among males and 37.5% among females. This is adequate to replace the working population of older age-group

taking into consideration the declining mortality. With the declining mortality, the proportion of both men and women will also rise and the proportion is expected to be about 39% both in the case of males and females in 1971 and about 35% in 1981. The proportion of males and females available for working force in the age-group 0-14 is far greater in rural areas

than in urban. This is largely due to the poverty of the people and to the greater scope of employment in the agricultural sector.

**Workers classified by sex and age**

35. The following table will help us to analyse the relative strength of working force in different sectors by sex and age.

TABLE XII — 24 (Contd.)

While 69 out of 1,000 males are employed in primary sector in the 0-14 group, only 60 out of 1,000 males are engaged in the secondary group and the corresponding proportion in the tertiary sector is 33. In the case of females, the proportion is 123 in the secondary sector which is higher than that of the primary sector (77). It is in the category of mining and quarrying (category III) the proportion among 0-14 is highest both in the case of males and females.

Among the proportion of males in each sector, the proportion of 60 + age-group is highest in primary sector (83) next in tertiary sector (50)

and the last in secondary sector (46). In the case of females, the highest is found in tertiary sector. The proportion of 60 + age-group male workers is highest in the category of cultivators (97) and lowest in transport. Among females, the highest is in cultivators and other services and the lowest in mining and quarrying.

#### **Workers classified by rural and urban areas**

36. The following table presents the distribution of workers in each sector and in each category for total, rural and urban areas separately in each broad age-group population as 1,000.

The proportion of males and females in the working force among 0-14 and 60+ age-groups is three times higher in rural areas than in urban. It is the primary sector that mainly accounts for such workers in these two age-groups. Among male workers in the category of agricultural labourer and manufacturing 15-34 age-group predominates and in all other categories 35-59 is the predominating group. Among female workers, the

proportion of 15-34 age-group predominates in the categories of mining and quarrying and household industry. In all other categories 35-59 age-group is predominant. Except in the age-group of 0-14 in the category of household industry, in no other category and no other age-group the proportion of females is greater than the corresponding proportion of males.

## Part — C

## Population in Agriculture and Primary Sector of Industry

**General**

37. Over-dependence on agriculture is a natural characteristic of underdeveloped countries like India. In a General Census there is only a limited scope for collecting information on agriculture. As such, in a few countries a separate Agricultural Census is conducted. I do not know when India will have a comprehensive Agricultural Census. However, to make it as much comprehensive as possible, it has collected in 1961 through a Household Schedule all possible information on land cultivated by a household on ownership or on tenancy basis or on both and on household industry, if any, conducted by the household and the number of family workers and hired workers employed in these activities. Also, information on the different systems of land tenures that are in existence have been collected through this schedule.

Upto 1951 agricultural population had been classified into 4 major classes of (i) landlords who did not cultivate (ii) owner cultivators (iii) tenants at will and (iv) agricultural labourers. In 1961 they are treated as (a) rentiers who did not work (b) cultivators and (c) agricultural labourers. Of this, rentiers who did not work were treated as non-workers. The other two became the first and second category of workers. Thus in 1961 there was a shift in emphasis from land ownership status to activity status.

**Concept of Cultivators and Agricultural Labourers through the decades**

38. In the individual slip of 1961 Census the concept of cultivator is not linked to the actual ownership of the land but to the mere fact of actual cultivation irrespective of to whom the land belongs, provided the risk involved in cultivation is assumed by the cultivator. It excludes those who work in the field for wages in kind or cash without any direct interest. They are known as agricultural labourers. A distinction is thus made between the cultivator and the agricultural labourer. Thus it is also different from the legal concept of 'Cultivator' which is based on the right of ownership of the land. The term

'Cultivator' used in individual slip includes both owner cultivators and tenant cultivators and does not denote a title in land but a type of arrangement under which the land has been cultivated. A person has been treated as a cultivator if he or she is engaged as an employer, single worker or family worker in (1) cultivation of land or supervision or direction of cultivation of land owned or held from Government; (ii) cultivation of land or supervision or direction of cultivation of land held from private persons or institutions for payment of money, kind or share in the produce of crops. Agricultural labourer is one who works on other's land for wages in cash or kind without having any supervision or direction in cultivation. He will not have any right to lease the land on which he works, nor will he be responsible for the crops he sows and he does not take any risk involved in it.

In the Census of 1901, the classification of persons depending on agriculture was (i) rent-receivers; (ii) actual workers including sharers; and (iii) field labourers. Rent payers and rent receivers were the two categories prescribed for the 1911 and 1921 Censuses. The concept of 1901 census was adopted during the 1931 Census and in 1941 Census there was no significant change from the previous Censuses. In 1941 Census, the cultivating tenant was further classified as tenants on fixed rent and on varam rent. In 1951, the agricultural classes were distinguished as (i) Cultivators of land, wholly or mainly owned and their dependents (ii) Cultivators of land, wholly or mainly unowned and their dependents (iii) Cultivating labourers and their dependents and (iv) non-cultivating owners of lands, agricultural rent receivers and their dependents. In 1961 Census, though no such distinction was made nor such details gathered in the individual slip, in the household schedule which was a new feature of this Census, information on the interests in land for cultivating households were gathered under the headings (1) land owned or held from Government (2) land held from private persons or institutions for payment in money, kind or share and (3) land given to private persons for cultivation for payment in

money, kind or share. The extent of area under each of these interests was also collected. Thus it can be seen that till 1941, 'owner cultivator' denoted the possession of right of occupancy a term which covered all cultivators holding on a lease from Government as well as many others with a conditional or preferential right to their holdings subject to the periodic reassessment of rents. The definition underwent a change in 1951 according to which to classify as owner cultivator, the occupancy right which one possesses over the land should be heritable and transferable. In 1961, the definition underwent further changes including classification itself. Ownership has been defined as a right of permanent, heritable and transferable possession with or without the right of transfer. Along with that, land directly held from Government under a grant of lease or assignment and encroached lands have been included. Owner cultivators in the previous Censuses now correspond to item A 1 (1) in the Household schedule (i.e.) land owned or held from Government.

The interest that had been categorised as 'cultivating tenant' till 1941 has been modified giving emphasis on ownership. The interest is now termed as "Land held from private persons or institutions, for payment in money, kind or share." Crop-sharers and cultivating tenants of the earlier Censuses come under this category. In 1961 the non-cultivating owners correspond to those who are recorded against question 2 in part A of household schedule namely, land given to private persons for cultivation for payment in money, kind or share. These categories of persons who have been considered under the category of agriculturists upto 1951 have been excluded from that category due to the change in concept of cultivation adopted in 1961.

The questions 8 & 9 in individual slip relate to cultivators and agricultural labourers respectively and Part A and C of household schedule relate to details for households engaged in cultivation and Part C relates to details for households engaged in cultivation and household industry.

### Questions on labourers in land during the decades

39. The questions asked on livelihood in land from 1901 to 1961 Censuses are given below with

the instructions.

**1901 Census : Principal Occupation of Actual Workers.** In the case of agriculture, distinguish (1) Rent Receivers (2) Actual Cultivators including sharers and (3) field labourers, separating those regularly employed from those who work by the day or by the job. Gardeners and growers of special products such as tea, betel, etc., should be entered separately.

**1911 Census : Principal Occupation of Actual Workers.** In the case of agriculture, distinguish between persons who receive rent and those who pay rent.

**1921 Census : Principal Occupation of Actual Workers.** In the case of agriculture, distinguish between persons who receive rent and those who pay rent. If any further sub-division of agriculturists is contemplated in any province, provision will have to be made for it in this rule.

**1931 Census : Principal Occupation of Actual Workers.** In the case of agriculture, distinguish between persons who do not cultivate personally, who cultivate their own land, who cultivate rented land and who are hired labourers. Persons living on an income derived from agriculture must be distinguished as owner (i.e., non-cultivating), cultivating owners, cultivating tenants (whether the rent is paid in kind or in cash) or agricultural labourers. Where a person cultivates part of his land and sublets part, he should be shown in column 10 as a cultivator and in column 11 as a landlord but if he gets the greater part of his income from land which he cultivates himself, then he should be shown as cultivating owner in column 10. Gardeners and growers of special products such as pan, etc., must be clearly described as pan grower, etc. Persons whose income is derived from the rent of a house or land in towns should be distinguished from those who derive it from agricultural land.

**1941 Census : Means of Livelihood.** In the case of agriculture distinguish between persons who do not cultivate, who cultivate their own land, who cultivate rented land and who are hired labourers. Distinguish also persons who work land on batai (share-croppers).

**1951 Census : Principal Means of Livelihood.** Write 1. for a person who cultivates land owned by him; 2. for a person who cultivates land owned by another person; 3. for a person who is

employed as a labourer by another person who cultivates land; 4. for a person who receives rent in cash or kind in respect of land which is cultivated by another person. Learn to distinguish between "cultivation of the land" and "performance of labour necessary for cultivating the land". There are, of course, millions of persons who perform both functions but the functions are distinguishable and should be distinguished. The man who takes the responsible decisions which constitute the direction of the process of cultivation (e.g. when and where to plough, when and what to sow, where and when to reap and so on) it is this person who should be referred to as the cultivator even though he does not perform any manual labour whatever. The man who ploughs, or sows or reaps under the directions of someone else is not the cultivator but a cultivating labourer, a different thing

altogether.

The cultivator may be the owner of the land cultivated. In that case, he is category 1 whether or not he also continues himself in the functions of a cultivating labourer.

Alternatively, the cultivator may be a lessee, an agent or manager (paid or unpaid). Even in this case, it is immaterial whether this lessee or agent or manager also combines in himself, the functions of a cultivating labourer; he (the cultivator) is category 2, and the other person (the owner) is category 4.

1961 Census: Interest in land. (Household Schedule) (1) Land owned or held from Government (2) Land held from private persons for payment in money, kind or share (3) Partly owned or held from Government and partly from private persons for payment in money, kind or share.

<i>Census</i>	<i>Cultivator</i>	<i>Agricultural labourer</i>
1901	Actual workers (agriculturists and partially agriculturists) and dependents; rent payers cultivators; fruit and vegetable growers; agents and managers of landed estates (not planters)	Actual workers (agriculturists and partially agriculturists) and dependents; farm servants; field labourers.
1911	Actual workers (agriculturists and partially agriculturists) and dependents; ordinary cultivators, agents, managers of landed estates (not planters) clerks, rent collectors, etc.	Actual workers (agriculturists and partially agriculturists) and dependents; farm servants and field labourers.
1921	Actual workers and dependents; ordinary cultivators including cultivating owners, cultivating tenants and cultivators unspecified and agents, managers of landed estates (not planters) clerks, rent collectors, etc.	Actual workers and dependents; farm servants and field labourers.

<i>Census</i>	<i>Cultivator</i>	<i>Agricultural Labourer</i>
1931	Farmers in principal occupations and working dependents; estate agents and managers of owners; estate agents and managers of Government cultivating owners; tenant cultivators.	Earners in principal occupations and working dependents; agricultural labourers.
1941	Independent workers and partly dependents; exploitation of animals and vegetation; cultivators and cultivation of special crops.	
1951	Self-supporting persons and earning dependents (secondary means), livelihood classes I and II.	Self-supporting persons and earning dependents (secondary means) livelihood class III (cultivating labourers).

**Statement of comparability of categories of Cultivators and Agricultural labourers with earlier Census categories**

40. The following statement presents the numbers of the classes and groups in earlier censuses equivalent to the Industrial Categories I and II of this Census, namely, cultivators and agricultural labourers.

1. Workers at cultivation 1961 (Cultivators)	... Self-supporting persons and earning dependents (secondary means) in livelihood classes I and II of 1951
	... Earners and working dependents in Groups 2, 3, 5, 6 and 8 of 1931
	... Actual workers in Groups 2 and 3 of 1921
	... Actual workers in Groups 2 and 3 of 1911
	... Actual workers in Groups 37, 40, 52 and 56 of 1901
2. Agricultural labourers, 1961	... Self-supporting persons and earning dependents (secondary means) in livelihood class III of 1951
	... Earners and working dependents in Group 7 of 1931
	... Actual workers in Groups 4 and 5 of 1921
	... Actual workers in Group 4 of 1911
	... Actual workers in Groups 38 and 39 of 1901

**Cultivator**

41. The following table presents the proportion of persons working at cultivation to 1,000 of total population in the Censuses of this century.

TABLE XII — 26

*Proportion of persons working at Cultivation to 1,000 of total population  
1901--1961*

State and Districts	1961	1951	1931	1921	1911	1901

Madurai	177	106	147	188	299	206
** Tiruchirapalli	270	146	214	297	280	429
Thanjavur	152	111	114	177	165	183
Ramanathapuram	254	131	163	146	281	357
Tirunelveli	161	105	133	192	198	
Kanyakumari	73	83	84	83	103	...

\* Excluding Kanyakumari

\*\* Excluding Pudukottai

The proportion of persons working at cultivation has been gradually diminishing from 1901 to 1951 from 256 to 113 but in 1961 it has again risen steeply to 192 and has reached the level of 1921 proportion. With the increasing industrial trend in India this cannot be explained except on the basis that the definition adopted in 1961 is almost similar to the one adopted in 1921. Further it will follow that industrialisation has not affected

to any extent the dependence of our rural folk on agriculture during 1921-61. However, this period has also witnessed remarkable progress in agriculture with the result that it can support effectively a large segment of population.

In all districts excluding Kanyakumari, 1961 proportion is higher than that of 1951. Kanyakumari district depicts more the picture of Kerala of which it formed part till the reorganisation of

States in 1956. The proportion has declined from 83 to 73. The districts of Salem, Ramanathapuram and North Arcot have recorded high increase from that of 1951 figures. Ramanathapuram Salem and North Arcot are the three districts in the descending order which have recorded highest increase in the total cropped area during the inter-censal period. The increase amounts to 7 lakhs acres in Ramnad, 5 lakhs in Salem and 4 lakhs in North Arcot district. This increase in cultivated area would be one of the reasons for the high increase in the proportion of cultivators in these districts. The sudden rise in the number of cultivators can be also ascribed to the mass scale transfers of land to those who did not have any land and to those who had less than the ceiling that were done to evade ceiling on land holdings. The lack of adequate employment opportunities in non-agricultural sector could have also been responsible for increase in the number of cultivators. It can be seen from the Subsidiary Table B-1-3 that among the total workers, the cultivators form 42%. The proportion among male and female workers is almost the same being 41.9% among male workers and 42.4% among female workers.

#### Proportion of cultivators and cropped area

42. The following is the proportion of cultivators to total workers in the districts. They are arranged in the descending order of proportions.

Tiruchirapalli	54.8
Salem	54.7
Ramanathapuram	53.0
North Arcot	51.5
South Arcot	49.5
Madurai	39.0
Thanjavur	36.3
Tirunelveli	35.2
Chingleput	35.1
Coimbatore	30.3
Kanyakumari	20.7
Nilgiri	18.9

The ranking of districts arranged in the order of extent of total cropped area in 1960-61 pre-

sents a slightly different picture.

Salem  
Coimbatore  
Tiruchirapalli  
Thanjavur  
South Arcot  
Madurai  
North Arcot  
Ramanathapuram  
Tirunelveli  
Chingleput  
Kanyakumari  
Nilgiri

In Salem the total cropped area is higher than all other districts and the proportion of workers working as cultivators also is higher than all districts except Tiruchi. This shows that this is primarily an agricultural area. In Coimbatore even though the cropped area is higher than all other districts except Salem, the proportion of cultivators among the workers is very low. Thanjavur ranks fourth in the cropped area but in the proportion of cultivators, it ranks eighth. This indicates that in these two districts the pressure on land is not high. Ramnad and North Arcot present an opposite picture of great pressure on land in which while the proportion of cropped area is much lower than 6 of the 12 districts, the proportion of cultivators among workers is much higher than 8 of the 12 districts.

#### Sex-wise proportions among cultivators

43. The proportion of female workers to male workers ranges from 2 per 100 workers in Madras district to 84 per 100 in Nilgiri district. In the rural areas the percentage of workers in the category of cultivation ranges from 64 among males in Ramanathapuram and 61 in Salem among females, to 24 in Madurai among males and 6 among females in Kanyakumari. In the urban sector, the proportion ranges from 10% in Tirunelveli to 0.02% in Madras among males and from 17.7% in Tiruchi to 0.004% in Madras among females.

**Agricultural Labourer**

44. In a State in which 42% of the working force are engaged as cultivators, it is not surprising that 18% of the total workers are

'agricultural labourers'. The following table presents similar proportions in respect of agricultural labourers.

**TABLE XII — 27**

*Proportion of persons working as Agricultural Labourers to 1,000 of total population  
1901 to 1961*

State/district	1961	1951	1931	1921	1911	1901
1	2	3	4	5	6	7
* Madras State	84	55	88	95	100	112
Madras City	N	1	2	2	2	3
Chingleput	110	69	83	79	120	119
North Arcot	80	53	61	27	107	85

Salem	66	46	106	161	105	106
* Coimbatore	76	57	115	72	104	109
Nilgiri	51	49	44	107	61	49
Madurai	71	64	68	91	124	61
** Tiruchirapalli	81	49	151	167	100	167
Thanjavur	137	86	93	122	99	121
Ramanathapuram	69	43	43	59	38	187
Tirunelveli	74	42	91	75	70	
Kanyakumari	31	56	33	22	28	...

\* Excluding Kanyakumari

\*\* Excluding Pudukottai

The proportion of agricultural labourers also follows the similar pattern of decline from 1901 to 1951 and steep increase in 1961. Here too Kanyakumari is an exception. It can be seen from the Subsidiary Table B-I-3 that 14.3% of male workers and 26.4% of female workers are agricultural labourers. This category ranks

second in the proportion of workers to the total workers of the State. In Thanjavur district which is noted for cultivation the bulk of the cultivable land belongs to big Mirasdars. As such, the highest proportion of workers engaged as agricultural labourers, is in this district. 32.7% of the total workers of Thanjavur district are agricultural

labourers. Nilgiri and Kanyakumari have the least proportion of workers as agricultural labourers with 11% and 8.9%. In Thanjavur, 36.3% are cultivators and 32.7% are agricultural labourers, while in Salem 54.7% are cultivators and only 12.8% are agricultural labourers. In this district the ratio of cultivators to agricultural labourers is highest. For every 10 cultivators there are 9 agricultural labourers. As most of the cultivators belong to the well-to-do class in this area, in many cases the actual cultivation is done by labourers hired on wages while the cultivating Mirasdars confine their activities to direction and supervision. Salem presents the opposite picture. In this district the ratio of cultivators to agricultural labourers is lowest being 2 labourers for every 10 cultivators.

#### Ratio of cultivators to agricultural labourers

45. From the ratio of cultivators to agricultural labourers it can be said that Thanjavur is an example of capitalistic farming while Salem is an example of subsistence farming. Following is the number of agricultural labourers for every 10 cultivators in each district.

	No. of agricultural labourers
Thanjavur	9
Chingleput	7
South Arcot	6
Nilgiri	6
North Arcot	5
Coimbatore	5
Madurai	5
Tirunelveli	5
Kanyakumari	4
Tiruchirapalli	3

Ramanathapuram	3
Salem	2
State	4

The proportions of agricultural labourers to total workers of the districts are given below. They are arranged in the descending order of proportions.

Thanjavur	32.7
South Arcot	28.7
Chingleput	25.3
Madurai	20.1
North Arcot	17.1
Tiruchirapalli	16.3
Tirunelveli	16.1
Coimbatore	15.7
Ramanathapuram	14.4
Salem	12.8
Nilgiri	11.0
Kanyakumari	8.9

#### Female workers among agricultural labourers

46. The highest proportion of female workers is recorded in the category of agricultural labourers. There are as many as 96 females for every 100 male workers in this category for the whole State. In the district of North Arcot, there are 133 females per 100 males and in Ramnad and Tirunelveli 126 and 122. Excluding Madras, the lowest proportion of female workers in this category is found in Kanyakumari district, the proportion being 34 females per 100 male workers.

#### Sector-wise strength of workers in rural and urban areas

47. The relative strength of workers in each sector in rural and urban areas can be known from this table.

	U	1,000	1,000	74	12	154	80	266	48	506	860	

The predominance of proportions in primary sector in rural areas in all districts of the State compared to that of the urban is only a normal feature as by the very definition of urban area more than 75% of the population should be engaged in the non-agricultural sector. In the rural areas the proportion of male and female workers in Primary sector in Chingleput district, Coimbatore district, Tirunelveli district and Kanyakumari district falls below that of State average. Chingleput is adjacent to Madras City and has many industries which provide scope for non-agricultural employment. Coimbatore is the industrial centre of Madras State. Household industries provide greater scope of employment in Tirunelveli district. Kanyakumari presents the picture of Kerala of which it formed part till reorganisation. In rural areas of Thanjavur district the proportion among female cultivators is lower than that of State average, while among male workers it is high. This again indicates the better economic status of the cultivating families of this district. In the urban areas of the State the tertiary sector accounts for the highest proportion of workers among both males (27.8) and females (5.8). In the urban areas of Salem district alone both among males and females the proportion engaged in Secondary sector is highest. This again indicates the backwardness of the district. In the case of urban areas of Chingleput, Ramanathapuram, Tirunelveli and Kanyakumari districts the proportion in Secondary sector among females is the highest. This is due to the predominance of Household Industry of making Fredies, Cigarettes, in Tirunelveli district, of making matches in Ramanathapuram district and Household Industry of making fishing nets in Kanyakumari district. They provide large avenues of employment particularly to the females.

#### **Cultivators in the non-working age-group**

48. 5 % of the total male cultivators of the State in rural areas belong to 0-14 age-group. Salem records the highest proportion of 8.5% of male cultivators and 10.5% female cultivators in 0-14 age-group. This again indicates the backwardness of the area. It can be seen from Subsidiary Table B-I-4 that in the rural areas among male cultivators 5% and among female cultivators 6.8% belong to 0-14 age-group.

In all districts the proportion of female cultivators of 0-14 age-group exceeds the corresponding proportion among male cultivators. But it is exactly the reverse in the case of 60+ age-group where proportion among males exceeds very much the corresponding proportion among females. Among agricultural labourers the proportions in both 0-14 age-group and 60+ age-group are greater among males than females.

#### **Agricultural labourers in the non-working age-group**

49. The 0-14 age-group proportions among agricultural labourers are higher than those of cultivators and all other categories of workers. This can be explained by the fact that much of the inflation of workers has occurred in this category. The highest proportions in 0-14 age-group among male and female agricultural labourers are recorded in Salem district (Males 16.5%; Females 12.4%) and the lowest in Thanjavur district (Males 5.9%; Females 5.3%).

#### **Analysis of certain categories of Non-Workers**

50. The data may now be examined in relation to the age-structure of the non-working population, students, dependents and unemployed persons seeking employment in rural areas.

TABLE XII — 22 (Contd.)

*Proportion of persons by sex and broad age-groups in cultivation and agricultural labour and non-workers in rural areas compared to proportion of full-time students or children attending school, dependents, infants and children not attending school, persons seeking employment in rural areas, 1961*

'N' denotes negligible

Even among males seeking employment 5.5% belong to 0-14 age-group and among females 6.3% belong to 0-14 age-group. In Salem among females both the proportion of 0-14 age-group (11.4%) among workers of the district and the proportion of 0-14 (21.2%) among the females seeking employment is the highest as compared

to all other districts. This district has the highest rate of illiterates (71.2% for males and 92.4% for females). All these tend to show the economic backwardness of this area.

The table given above has been recast into the following form taking male and female in each age-group separately as 1,000.

# MADRAS STATE

PROPORTION OF AGRICULTURAL WORKERS TO THE  
TOTAL RURAL POPULATION AGE-GROUP 15-59, 1961

This table again reveals that the full-time students in the age-group of 0-14 is lowest in Salem district both among males and females (22.7% Males: 9.3% Females) as compared to other districts and that the workers in this age-group is highest in this district (Males 16%: Females 12.6%).

#### Industrial classification by Division and group of workers in Division 0

51. It may be recalled that industrial coding has been done for Category III to IX. As the branch relating to agriculture, livestock, forestry,

fishing and hunting (Division 0) comes under the Primary Sector, the pattern of industrial groups and in Division 0 will be discussed now.

The following table presents the distribution of workers in Industrial Division 0 per 10,000 of all workers coming under the industrial classification by Division and Groups for the State and for the districts of Coimbatore, Nilgiri, Tirunelveli and Kanyakumari. As only in these districts the proportion of workers in this branch to total workers form more than 5%, the table has been prepared for these districts alone.

TABLE XII — 32

	044	32	...	2	...
	048	2	...	N	...

'N' denotes Negligible

In the State, the Major Group 04 viz., Livestock and hunting accounts for the highest percentage of 2.5 among male workers and in the group 01 relating to Plantation crops the highest percentage of 3.2 is seen among female workers. The specific industry that accounts for the highest proportions among male workers is Pro-

duction and rearing of Livestock mainly for milk (2.3%) and among female workers in that of Production of tea in plantation (2.4%). Nilgiri being an important centre of production for tea in the country, next only to Assam, the proportion of workers coming under the Minor Group 010 (Production of tea in plantation) is very high

being 24% among male workers and 51% among female workers. Kanyakumari district being a coastal area, the industry of fishing, specifically fishing in sea, accounts for 9% of male workers.

### Secondary occupation

52. The economic condition of the cultivator almost necessitates an additional means of livelihood and the seasonal nature of the work facilitates this. Though the practice of secondary occupation can be said to indicate the economic backwardness and extent of under-employment, it need not necessarily be so.

4,698,478 male workers forming 46.5% of total male workers and 1,668,132 female workers forming 31.8% of total female workers have

secondary occupation. The proportion of males and females having additional occupation is greater among the category of cultivators than the other categories. 32% of male cultivators and 19% of female cultivators have secondary occupation. Among the cultivators who have secondary work, 74% work as agricultural labourers and among the agricultural labourers who have secondary work 91% work as cultivators. This clearly proves the inter-relationship of these two categories in the organic way and also the poverty and the economic condition of the persons belonging to these two industrial categories.

Following is the proportion of male and female workers having secondary occupation.

Principal Work	As Cultivators		Additional Work As Agricultural Labourers		At Household Industry	
	M	F	M	F	M	F
Cultivation	...	...	17.1	18.9	15.6	11.2
Agricultural Labour	8.4	6.0	...	...	0.6	0.1
Household Industry	7.2	2.4	2.7	2.0	...	...

Among the household industry workers who have secondary work, 68% are engaged as cultivators. The predominance of cultivation as a combination of secondary work for those engaged in

Household Industry and those working as agricultural labourers indicates again that many who cultivate the land have only very small-sized holding and they have only very meagre resources.

**Pattern of secondary occupation in India and States**

53. In India and in all States except Assam, Jammu & Kashmir, Punjab and Rajasthan, the pattern of distribution indicates that cultivation provides the main avenue for the under-employed.

In the States which form an exception, household industry as secondary work is more predominant than cultivation. It can also be seen

from this table that having an additional employment is more common among males than females. This is probably because women mainly attend to household duties and hence may not be in a position to take up additional work.

**Pattern in Madras State**

54. The following table gives the proportion of persons having secondary work in the districts of Madras State.

TABLE XII — 34

*Distribution of 1,000 persons who principally work as Cultivator or Agricultural Labourer or in Household Industry but also have secondary work in any of the three categories, 1961*

It can be seen from Subsidiary Table B-VII Part A-1 that in the rural areas 112 males and 66 females out of 1,000 cultivators have secondary work as agricultural labourers, and only 10 males and 4 females out of 1,000 cultivators are working at household industry. The proportion is highest in South Arcot in the case of cultivators working as agricultural labourers. While out of 1,000 agricultural labourers those working additionally as cultivators form only 44 males and 30 females, those additionally working at household industry amount to only 3 males and 2 females.

Main Table B-VII Part A shows that among the males working at household industry and additionally working as cultivators the largest number forming 15.3% belong to the industries of manufacture of wood and wooden products, and the industries relating to manufacture of food-stuffs account for another 14%. The type of work in these industries is allied with agricultural work.

The pattern of combination of cultivation as principal work and agricultural labour or work connected with agriculture as secondary work has been the same in earlier decades also.

TABLE XII - 35

*Secondary means of livelihood in agriculture for the four non-agricultural classes, 1951*

State/District	No. of self-supporting persons per 10,000 of all non-agricultural classes	No. of self-supporting persons per 10,000 of self-supporting persons in all the non-agricultural classes whose secondary means of livelihood is

	b	1,000	794	206
	U a	817	746	71
	b	1,000	913	87

a—Absolute figures

b—Proportion of 1,000

Among the total households engaged in cultivation only and those engaged in both cultivation and household industry, the latter form only 5.5%. Excepting the districts of Coimbatore, Madurai, Tirunelveli and Kanyakumari in other districts of the State the proportion of households engaged both in cultivation and household industry is

greater in rural areas.

### Land utilization

56. The following table provides an insight into how the land of the State is utilised and to what extent it is utilised well.

TABLE XII — 38

TABLE XII — 39 (Contd.)

*Classification of area in each district of the Madras State in 1960-61*  
(Percentage to total area)

State District	Net Area sown	Area sown more than once	Total cropped area
	10	11	12
Madras	...	...	...
Chingleput	39.7	16.3	56.0
South Arcot	50.6	16.1	66.7
North Arcot	42.1	12.0	54.1
Salem	45.7	6.1	51.8
Coimbatore	45.0	11.8	56.8
Tiruchirappalli	49.1	6.7	55.8
Thanjavur	60.6	18.9	79.5
Madurai	44.6	8.2	52.8
Ramanathapuram	46.6	3.8	50.4
Tirunelveli	43.7	9.4	53.1
Nilgiri	19.1	0.8	19.9
Kanyakumari	48.8	19.5	68.3
State	46.1	10.1	56.2

5.4% of the land in the State is culturable waste i. e., lands which are available for cultivation but not taken up for cultivation at all or taken up for cultivation once but not cultivated during the current year and previous five years or more in succession. Culturable waste is minimum in Kanyakumari district and maximum in Nilgiri. More than half of the area in the State is cropped area. Thanjavur district has the highest percentage of cropped area to total area compared to other districts, but at the same time it has the

highest proportion of land put to non-agricultural use as compared to other districts. South Arcot, Ramanathapuram and Kanyakumari districts have the largest proportion of barren and unculturable land

#### Land revenue

57. The incidence of land revenue is quite high in this State. While in most of the other States it is only less than Rs. 1-50, in this State it is Rs. 2.36.

TABLE XII — 40

*Incidence of Land Revenue in various States, 1951*

State	Incidence per acre of total area	Incidence per acre of cultivated area		
		First type of land	Second type of land	Third type of land
1	2	3	4	5
1. Andhra Pradesh	Rs. 3.57 (per acre of net area sown)	Rs. 1.12 Minimum } Wet Rs. 18.85 Maximum } land	Re. 0.12 Minimum } Dry Rs. 8.25 Maximum } land	...
2. Gujarat*	Rs. 1.36	Rs. 1.45	...	...
3. Madras	Rs. 2.36	Rs. 3.12 (per acre of cultivated area)	..	...
4. Mysore	Rs. 1.20	Rs. 1.56 -do-	...	...
5. Punjab	Rs. 1.07	Rs. 1.33 -do-	...	...
6. Delhi	Rs. 1.05	Rs. 1.67	...	.
7. Andaman and Nicobar Islands	N.A.	N.A.	N.A.	N.A.
8. Laccadive, Minicoy and Amindivi Islands	N.A.	N.A.	N.A.	N.A.
9. Tripura	Rs. 1.26 (per acre of gross cropped area)	Rs. 1.50 (for net area sown)	...	..
10. Goa, Daman and Diu	N.A.	N.A.	N.A.	N.A.
11. Nagaland	N.A.	N.A.	N.A.	N.A.

N.A. means Not Available

\* Data for Surendranagar, Amroli, Ahmedabad and Baroda Districts are not received, and hence the incidence of land revenue for the State has been worked out on the area and land revenue of the remaining districts.

**Irrigation**

58. In 1960-61, 6,084,348 acres forming 41.1% of the net sown area were irrigated. The largest

proportion of net area irrigated to that of net area sown is recorded in Thanjavur district (85.3%) and in Chingleput (74.4%).

**District-wise percentage of net area irrigated to net area sown for 1960-61**

State/District	Percentage of net area irrigated to net area sown
Chingleput	74.4
South Arcot	49.9
North Arcot	38.6
Salem	17.3
Coimbatore	36.6
Tiruchirapalli	27.7
Thanjavur	85.3
Madurai	35.5
Ramanathapuram	44.6
Tirunelveli	31.6
Nilgiri	1.5
Kanyakumari	34.5
State	41.1

(Source - Season & Crop Report, 1961, P. 32)

The chief sources of irrigation in order of importance are tanks which irrigate 38% of the total irrigated area in the State, canals which irrigate about 36% and wells which serve about one fourth of the total irrigated area.

**Source of irrigation and its extent, 1960-61**

Sources of irrigation	Percentage of area irrigated from the source to the total area irrigated
Tanks	38.0
Government canals	35.7
Wells	24.3
Other sources such as spring channels, etc.	1.9
Private canals	0.1

(Source - Season & Crop Report, 1960-61, P. 5)

Canals are the principal sources of irrigation in the deltaic district of Thanjavur. Tanks are the important sources in the districts of Ramanathapuram, Chingleput, Tirunelveli, North Arcot and South Arcot. Wells are the chief source of irrigation in Salem and Coimbatore districts. In the district of Madurai all these three sources are of equal importance.

The proportion of area irrigated more than once forms more than three-fourths of the net irrigated area in Kanyakumari district. The following statement gives the district-wise proportion.

State/District	Percentage of area irrigated more than once to net irrigated area
Madras State	31.40
Chingleput	34.26
North Arcot	58.65
South Arcot	22.07
Salem	34.68
Coimbatore	29.92
Nilgiri	...
Madurai	36.64
Tiruchirapalli	40.21
Thanjavur	21.15
Ramanathapuram	4.93
Tirunelveli	57.09
Kanyakumari	86.86

**Crop analysis in irrigated area**

59. It is indeed nothing surprising that more than 90% of the area irrigated are those under food crops. The following statement presents the area irrigated under food and non-food crops as percentage of total area irrigated.

State / District	Area irrigated under food and non-food crops as percentage of total area irrigated		
	Total cereals and Millets	Total food crops	Total non-food crops
Madras State	84.55	91.80	8.20
Chingleput	93.99	95.74	4.26
North Arcot	90.20	97.09	2.91
South Arcot	85.03	90.07	9.93
Salem	76.95	91.86	8.14
Coimbatore	61.30	72.14	27.86
Nilgiri	...	100.00	...
Madurai	80.48	88.82	11.18
Tiruchirapalli	85.52	94.52	5.48
Thanjavur	95.76	98.04	1.96
Ramanathapuram	82.31	92.69	7.31
Tirunelveli	83.32	93.11	6.89
Kanyakumari	70.76	89.92	10.08

This situation is found uniformly in almost all districts of the State. Among the total food crops, the largest proportion is accounted by cereals and millets. Only in Coimbatore district, the area irrigated under non-food crops exceeds one-fourth of the total area irrigated. This is because in Coimbatore district cotton and groundnut are extensively cultivated and the area under cotton is the highest in this district compared to all other districts. The percentage of

### Chief crops

60. Food crops are cultivated in this State in more areas than the non-food crops and the food crop area in 1960-61 formed three-fourth of the total area sown. Paddy accounts for half of the area under food crops. The other important food crops are cholam, cumbu and ragi. Among the non-food crops, groundnut and cotton are the important crops. Needless to say that among the districts the percentage of area under food crops to total area sown are highest in Thanjavur district and lowest in Nilgiri district. In 1960-61, the area under food crops registered an increase of 719,856 acres over the normal area or the average of five years ending 1959-60. The following table gives the area under food crops and non-food crops in each district of the State with separate figures for important crops.

TABLE XII — 41

(Source : *Season and Crop Report of Madras State, 1960-61 pp. 68-76*)

Thanjavur contributes the largest share in the production of rice and the districts of South Arcot, Chingleput and North Arcot are the other areas which make significant contribution. Salem contributes the highest among millets, cholam, cumbu and ragi which form the main items of food next to rice. Coimbatore also is mainly a millet producing area. This district produces more than one third of the cotton produced in the State.

#### Average yield per acre

63. The total outturn depends not only on the extent under cultivation but also on other factors like climate, ecology, technique, etc. The following table gives the average yield per acre for the principal crops during 1960-61 and this will indicate the fertility of the soil and the use of improved techniques.

TABLE XII — 45

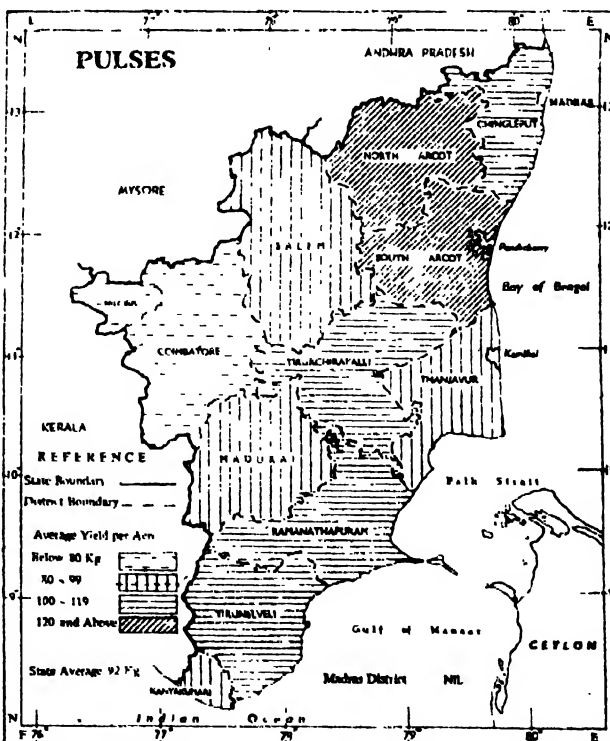

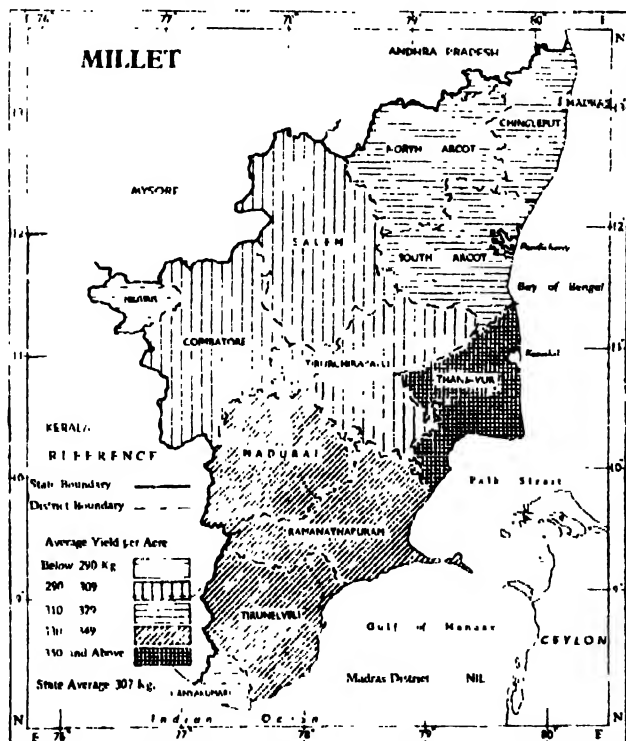

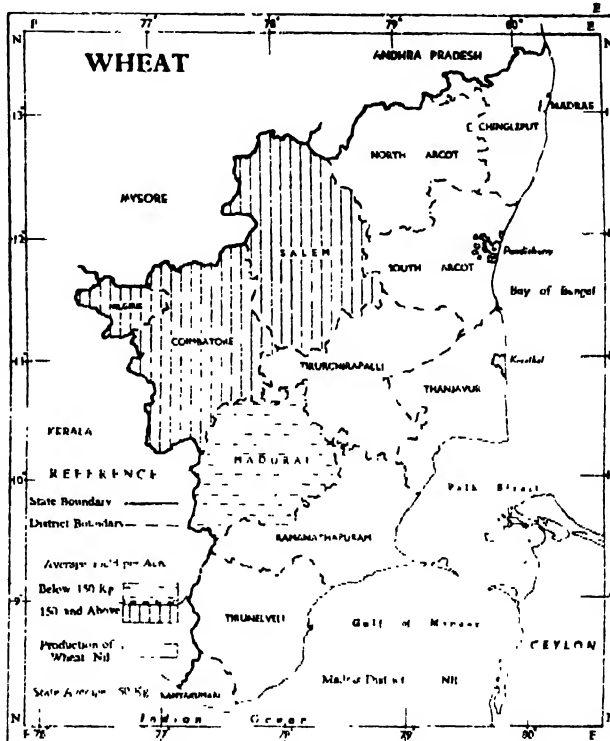

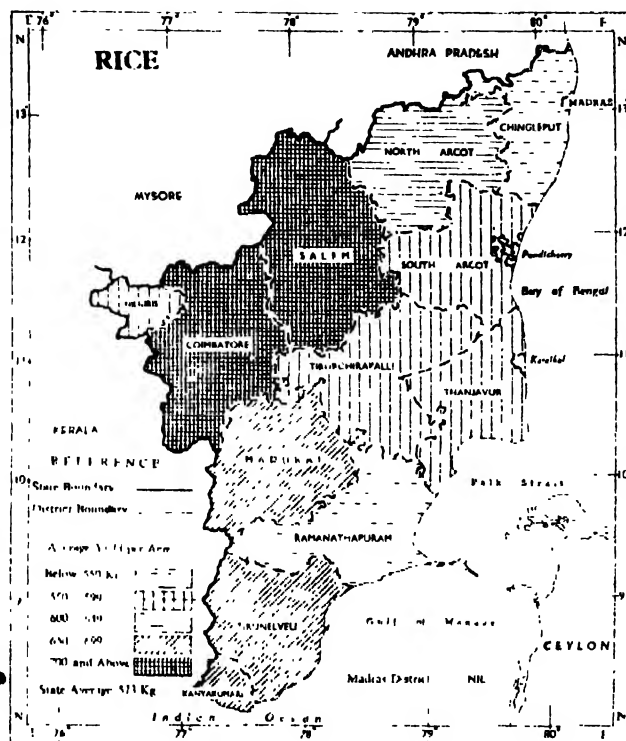

*Average yield per acre for chief crops during 1960-61*

\*In the case of Gujarat and West Bengal, the first two years of the period under consideration were somewhat abnormal. Leaving out these two years, the growth rates for the period 1954-55 to 1961-62 are given in brackets.

(Source—*Population, Land Resources and Agricultural Growth*, S. R. Sen, *Papers contributed by Indian authors to World Population Conference, Belgrade, 1965*, p. 120)

Madras has recorded the highest increase in productivity in India. The rate of increase in agricultural production is four times higher than that of the increase in population. In spite of the density of population per cultivated area being quite high, the agricultural growth rate is high.

#### Regions of development

68. Taking into consideration the value of output per acre as a rough index of productivity, the Techno-Economic Survey report of Madras classifies the districts into three groups Viz. well developed region, region with average development and region with low development. The districts of Kanyakumari, Thanjavur, South Arcot, Chingleput and North Arcot have been grouped

as the well-developed region, the south-western region comprising the districts of Tirunelveli, Madurai and Tiruchi as the region with average development and the districts of Salem, Coimbatore and Ramnad as the less developed agricultural region.

#### Food Problem

66. More than the deficit in overall production of food, it is the difficulty of equitable distribution throughout the country that creates the food problem. The following table illustrates the availability of cereals to every individual if the demand is to be met only from the production within the State.

TABLE XII — 47

*Cereals available in pounds per head, per year from production within States*

State	Rice	Wheat	Other cereals	Total cereals	Remarks (Other cereals grown)
Andhra	224	...	158	382	Jowar, Millets
Assam	300	...	...	300	Wheat, a little Millets
Bihar	230	21	58	309	Wheat, Millets

Mysore	112	8	142	262	Millets (Ragi)
Orissa	477	...	...	477	Only Rice
Punjab	44	268	121	433	Wheat, Millets
Rajasthan	6	104	230	340	Wheat, Millets
Uttar Pradesh	89	110	103	102	Wheat, Millets, Barley
West Bengal	345	...	...	...	Rice only, a little Maize
India	173	44	112	339	

(Source : *Increasing agricultural production in India: Prof. M. R. Balakrishnan, Madras Information, December 1966, P. 24*)

During the First Five Year Plan the food production in Madras State increased from 38 lakh tons to 44 lakh tons and against a target of 12.79 lakhs of additional production during the Second Plan, 9 lakh tons were achieved. Thus the total production in 1961 stood at the level of 53 lakh tons.

It is interesting to note from the following table that Madras State has the highest yield per acre of rice as compared to all other States in India. The yield in Kerala also is very high and the main reason for the inadequate availability of rice in Kerala is the population pressure which is seen from the highest density of population per square mile.

TABLE XII—48

*Yield in Pounds per acre of Rice (Cleaned)  
and Density of population in the various  
States 1960—61*

State	Yield in pounds per acre	Density of population per square mile
Andhra	1,143	339
Assam	851	252
Bihar	771	691

#### Agricultural labour enquiries of 1950-51 and 1956-57

67. Two agricultural labour enquiries were conducted, one in 1950-51 and another in 1956-57. The enquiry in both the cases was conducted in the rural areas. Households and not individuals, formed the basis of enquiry. Both in the first and second enquiry, a household was defined as comprising a group of persons who live in the same roof and normally take meals from the same kitchen. The term 'agricultural labour' was confined in the first agricultural labour enquiry to those employed for wages in the process of crop production only. In the second enquiry, hired employment in other agricultural occupations like dairy farming, horticulture, raising of livestock, bees or poultry etc., was also covered besides cultivation of land for farming purposes. The quantum of hired employment in agriculture was taken as the basis to classify a household as an agricultural labour family in the first agricultural labour enquiry. All those who were engaged as hired labourers in agricultural occupations for 50 per cent or more of the total number of days worked by them during the previous year were deemed to be agricultural labourers. In the second enquiry the basis adopted for demarcation of agricultural labour families was income and not employment.

According to the first enquiry, 2.7 million households were agricultural labour households in the rural areas and this constituted 55.1 per cent to the total rural households. In the second enquiry, the agricultural labour households in the rural areas amounted to 1.9 million which constituted 36.5 per cent to the total rural households. The estimated number of agricultural labourers in the rural areas of the State according to the second enquiry was 3,807 thousands.

#### Comparison of the data of agricultural labour enquiry with that of census

68. According to the Census figures of 1961, the agricultural labourers constitute 2,673 thousands in the rural areas of the State. In Census, the unit was individual for the purpose of classification of workers. Hence the data collected from Census cannot be compared with that of the agricultural labour

enquiry. While Census count covered all the individuals, the agricultural labour enquiry was conducted only in sample households. Moreover, in Census the hired workers in dairy farming, poultry, etc., were not treated as agricultural labourers but were treated as plantation workers. The term 'agricultural labourer' was limited to those who work on another's lands for wages in cash or kind without having any super-

vision or direction in cultivation. Growing of other field produces does not come within the purview of cultivation. The difference between Census figures and that of the agricultural labour enquiry may probably be due to the inclusion of other hired workers also as agricultural labourers in the agricultural labour enquiry.

TABLE XII—49

*Comparison between the Census figures and those of the First and Second Agricultural Labour Enquiries in respect of agricultural and non-agricultural rural population, 1961 and 1951.*

State	1961	1951	Agricultural Labour Enquiries II	Agricultural Labour Enquiries I
Madras State	Percentage 10.8	7.12	36.5	55.1

The following table gives the distribution of families living as tenants at will and as agricul-

tural labourers as found from the first agricultural labour enquiry.

TABLE XII—50

*Distribution of families living as tenants at will or Bargadars and as Agricultural Labourers in the year 1949*

State/District	No of families inquired into	Living mainly or entirely as tenant at will or share croppers		Living mainly or entirely on agricultural wages	
		No.	Percentage	No.	Percentage
1 Irrigated taluks of Chingleput, South Arcot, North Arcot, Tiruchirapalli and Madurai and the entire districts of Thanjavur, Ramanathapuram and Tirunelveli	6,145	471	7.66	3,022	49.18
2 Dry taluks of South Arcot, North Arcot, Tiruchirapalli and Madurai and the districts of Chittoor, Salem and Coimbatore	7,063	249	3.53	3,780	53.52
3 Nilgiri	1,004	3	0.30	438	43.63

(Source: Agricultural Labour Enquiry, (Agricultural wages in India) Vol. 1, Year 1952. Ministry of Labour.)

It can be seen that the proportion of families living mainly on agricultural wages is much higher than the proportion living mainly as share

croppers and it is particularly higher in the dry taluks than the irrigated taluks.

## Part — D — Cultivating Households

**Classification of cultivating households**

69. The discussion on cultivating households is based on the data collected through the sample Household Schedules. The relevant data are presented in Tables B-X, B-XI, B-XII, B-XV in the Household Economic Table volume and in SCT-V. As stated earlier, the households have been classified into the four categories of those (i) engaged neither in cultivation nor household industry; (ii) engaged in cultivation only (iii) engaged in household industry only, (iv) engaged both in

cultivation and household industry.

The household Schedule, its concepts and definitions have been already explained in the earlier section.

**Distribution of cultivating households**

70. The following table will show the distribution of households in the important types of economic activity, namely cultivation, and household Industry, in rural and urban areas.

TABLE XII — 51

*Distribution of 1,000 households in rural and urban areas among those engaged in Cultivation only, in Household Industry only, both in Cultivation and Household Industry and in neither, 1961*

	R	1,000	410	347	153	90
	U	1,000	765	129	64	12

Of every 1,000 households in the State 489 households are engaged neither in cultivation nor household industry. 424 households are engaged in cultivation only and 62 households in household industry only. Only 24 out of 1,000 households are found engaged both in household industry and cultivation. The data for the rural and urban areas if analysed separately give a more accurate picture of such economic activities. The proportion of cultivating households is six times higher in the rural areas than in the urban areas. As against the proportion of 544 per 1,000 households engaged in cultivation only in the rural areas, there are only 81 per 1,000 households in the urban areas. The proportion of households engaged in household industry only is 83 in the urban areas as against 55 in the rural areas. In the urban areas, there are more households depending on household industry alone for their livelihood. While there are 32 households per 1,000 engaged in both cultivation and household industry in the rural areas, there are only 5 per 1,000 households in the urban areas. The urban areas possess a very high proportion of 831 households engaged neither in cultivation nor household industry. As one of the criteria for defining an area as urban is that 75% of the population should be non-agricultural, it is only natural that the proportion of non-cultivating households is quite high.

#### **Households engaged neither in cultivation nor household industry**

71. The highest proportion in this category is found in Madras city where there are 980 households for every 1,000. The rural average of such households in the State is exceeded in the districts of Nilgiri, Thanjavur, Coimbatore, Chingleput, Madurai and Kanyakumari in the descending order. Nilgiri is mainly a plantation area and as plantation crops are not included under cultivation such a high proportion of households which are neither engaged in cultivation nor in household industry is recorded. The high proportion of this category of households in Thanjavur is again indicative of concentration of cultivating lands in a few households. The State average for urban areas is exceeded by the urban areas of the districts of Madras, Nilgiri, Coimbatore,

Thanjavur and Tiruchirapalli. The lowest proportion is found in the rural areas of both Tiruchirapalli and Ramanathapuram districts where there are 273 households per 1,000.

#### **Households engaged in cultivation only**

72. While more than half of the households in the rural areas are engaged in cultivation, not even one-tenth of the total households in urban areas are engaged in cultivation. The largest proportion of 658 households per 1,000 is found in the rural areas of Tiruchirapalli district and this is closely followed by the rural areas of Ramanathapuram district where 657 households out of 1,000 are cultivating households. The State proportion of 544 in this category in the rural areas is exceeded by Tiruchirapalli, Ramanathapuram, North Arcot, South Arcot, Salem and Madurai in the descending order. Tiruchirapalli is a fertile agricultural area. Though Ramanathapuram district is not a fertile region, being a very backward industrial area, agriculture is the primary economic activity of these people. The proportion in the urban areas varies from 1 in Madras city to 134 in the South Arcot district.

#### **Households engaged in household industry only**

73. Dependence on household industry alone is comparatively higher in the urban than in the rural areas. The proportion in the rural areas ranges from 5 per 1,000 households in Nilgiri district to 153 per 1,000 in Kanyakumari district and the State average for rural areas is exceeded by the rural areas of the districts of Kanyakumari, Tirunelveli, Coimbatore and Salem. The reasons for wider prevalence of Household Industry in these districts have been indicated earlier. They will also be discussed further under household industry. In the urban areas, the proportions in the districts are between 14 (in Nilgiri district) to 234 (in Salem district).

#### **Households engaged both in cultivation and household industry**

74. The households engaged both in cultivation and Household industry form only 3% in rural areas and only 0.5% in urban areas. In the rural areas, the State average is exceeded by the districts of Kanyakumari, Tirunelveli, Coimbatore,

tore, Salem and North Arcot. As the pressure on land is high in Kanyakumari district many of the households have to supplement their income from land by household industry.

### Cultivating households in India and States

75. The following table presents the comparative figures for the States and India as a whole.

TABLE XII -- 52

*Distribution of 1,000 households in each State among those engaged in Cultivation only, in Household Industry only, both in Cultivation and Household Industry and in neither, 1961*

India/State		Total No. of households a) Absolute No. b) 1,000	Households engaged neither in cultivation nor household industry	Household: engaged in cultivation only	Households engaged in household industry only	Households engaged both in cultivation and household industry

	b.	1,000	149	847	2	2

In India the proportion of households engaged in cultivation only accounts for more than half of the households unlike in this State. Also unlike this State, in India the proportion of households engaged both in cultivation and household industry is greater than that of those engaged in household industry only. A regional pattern is observed among these proportions in the States. In Assam, Bihar, Orissa, Uttar Pradesh and Rajasthan proportions of households engaged neither in cultivation nor in household industry are very much less than the average for India as a whole. This State, Gujarat Maharashtra and Andhra form another group where the corresponding proportions are very much higher. In the case of households engaged in cultivation only the proportions are greater than all India average in Bihar, Jammu and Kashmir, Madhya Pradesh, Orissa, Rajasthan and Uttar Pradesh. The corresponding proportions in this State, Andhra, Gujarat, Maharashtra, Punjab and West Bengal are less than the All India average. These facts indicate that the States forming the second group namely Madras, Andhra, Gujarat and Maharashtra are more urbanised than the other group. The proportion of urban population in the different States confirms this trend. In the States of Punjab, Andhra, Madras, Kerala, Uttar Pradesh and Gujarat (in descending order) the proportions of households engaged in household industry only are greater than All India average.

#### Estimate of cultivated area through household schedules

76. From Union Table B-XI which deals with sample households engaged in cultivation classified by interest in land and size of land cultivated in rural and urban areas, the total area held by the cultivating households in this State has been estimated as 15 million acres. The variation between the estimated extent and the extent of net area sown and current fallow as obtained from the Season and Crop report is 6%.

The estimation from the table has been done by totalling up the sum of the product of the number of households in each class by the arithmetic or geometric mean of the two limits (upper and lower of each size class). Arithmetic mean has been adopted for size class upto 2.4 acres as

also between 12.4 to 14.9 and geometric mean for size classes between 15.0 to 49.9 acres (barring 12.4 to 14.9 acres). This has been decided after working out the actuals for certain selected representative areas. For class range 50 and above, maximum mean point 75.59 has been adopted. 6.40 acres have been taken as the mean for unspecified class as suggested by Registrar General with reference to actuals worked out. This being 20% sample tabulation, the result has been multiplied by 5. The figures available in the Season and Crop Report have been taken as official figure. The estimated land held by the cultivating households in each district compared with the official figure is given in the statement below :

State/ District	Official figure of net area cultivated (000 acres)	Estimated area under cultivation as per house- hold sched- ule (000 acres)	Percentage of variation (+ or -)
<b>Madras State</b>	<b>15,849</b>	<b>14,845</b>	<b>— 6.33</b>
Madras	N	N	N
Chingleput	922	710	— 22.95
North Arcot	1,356	1,202	— 11.33
South Arcot	1,310	1,410	+ 7.69
Salem	2,244	2,060	— 8.19
Coimbatore	2,126	2,159	+ 1.56
Nilgiri	60	66	+ 11.18
Madurai	1,504	1,358	— 9.69
Tiruchirapalli	1,875	1,883	+ 0.41
Thanjavur	1,307	1,287	— 1.54
Ramanathapuram	1,682	1,410	— 16.19
Tirunelveli	1,330	1,171	— 11.98
Kanyakumari	133	125	— 5.78

N = denotes negligible.

#### Comparison of the estimate with official figure

77. To compare the estimated figures of the land held by cultivating households as arrived from the household schedule with the official figure, it is necessary to know the limitations under which the estimation has been done. As

per Census definition, cultivation involves ploughing, sowing, and harvesting of certain specified crops which include:

1. Production of cereal crops, such as (paddy, wheat, maize, cholam, kumbu, ragi, etc.) and root and tubers like potatoes, sweet potatoes, tapioca, sugar-cane, etc.
2. Production of pulses, such as groundnut, bengal gram, green gram, red gram, black gram, horse gram, etc.
3. Production of raw jute and kindred fibre crops.
4. Production of raw cotton and kindred fibre crops.

It will not include the field produce such as :

1. Production of other crops including vegetables not covered under items 1 to 4 above.
2. Production of fruits and nuts in plantations, vines and orchards (banana, mango, cashew-nut, arecanut, coconut, betelvines, etc.)
3. Production of wood, bamboo, cane reeds, thatching grass, etc.
4. Production of juice by tapping palms (palmyra).
5. Production of other agricultural produce including fruits and nuts not covered (green manure crops, etc.)

It will also not include the plantation crops. They are (1) Production of tea, coffee, and rubber in plantation, (2) Production of tobacco in Plantation (does not include tobacco which is cultivated in rotation with other cereal crops in which case it would go under cultivation). (3) Production of ganja, cinchona, opium, pepper, saffron etc. and other medicinal plants. (4) Production of other plantation crops not covered by the above items (e. g. cardamom, glove, garlic and other spices.)

The examples are illustrative and not exhaustive.

#### **Reasons for difference between estimated figures and official figures**

78. In general, cultivation refers to all types of cultivation on ground, whereas Census definition of cultivation excludes certain specific items from the purview of cultivation which is normally recognized as cultivation for other purposes.

In Coimbatore, the excess is 1.56% and in Nilgiri it works out to 11.18%. Mixed cultivation of plantation and other crops which are popular in these districts might have added further difficulties to the enumerators. These might have been the likely causes for the increased acreage. South Arcot and Tiruchirapalli also show excess over official figures. It is 7.69% in South Arcot and 0.44% in Tiruchirapalli. We find large area of land in South Arcot (101,256 acres) under green manure crops and under vegetables and fruits (52,606 acres) in Tiruchirapalli. These are crops that are not covered under Census definition of cultivation yet treated as cultivation for all practical purposes. Wrong inclusion of areas covered by these crops may perhaps be the cause for the excess over the official figure. In all other districts, the estimated figures are less than the official figures. The difference is very conspicuous in Chingleput, Ramanathapuram, North Arcot, Tirunelveli and Madurai. The extent of land recorded in the Household Schedule will not cover the lands owned by Dewaswoms in Kanyakumari district and by the temples in other parts of the State if they were cultivated by employing hired labour. The total extent of land held directly by institutions and temples not covered by the Household Schedule may offset against the variance in some of these districts, especially in Kanyakumari, Tirunelveli, Ramanathapuram, Madurai and Chingleput. This may be the reason for the low figure. In addition, the estimated figure of acreage under cultivation is likely to possess certain percentage of error which is inherent in such estimation from samples.

Taking all these into consideration the estimated acreage compares favourably with the official figures. The results to certain extent give rise to optimism and strengthen the hope that through the Household Schedule such vital data on land can be obtained along with the gigantic operation of a population census and that the information can be collected with a reasonable amount of accuracy.

#### **Estimation of food production and consumption through household schedule**

79. An attempt has been made below to work out a broad estimation of the production and

consumption in the various districts and in the State as a whole, with reference to the acreage of land returned in the Household Schedule.

State/ District	Net yield available for consumption	Estimated consumption	Surplus or Deficit (+) (-)
(In Lakh Tons)			
Madras State	62.56	52.62	+ 9.94
Madras	0.01	2.52	— 2.51
Chingleput	2.99	3.39	— 0.40
North Arcot	5.07	4.60	+ 0.47
South Arcot	5.95	4.73	+ 1.22
Salem	8.68	5.83	+ 2.85
Coimbatore	9.10	5.64	+ 3.46
Nilgiri	0.28	0.63	— 0.35
Madurai	5.72	4.98	+ 0.74
Tiruchirappalli	7.94	5.22	+ 2.72
Thamavur	5.42	5.27	+ 0.15
Ramanathapuram	5.94	3.91	+ 2.03
Tirunelveli	4.93	4.49	+ 0.44
Kanyakumari	0.53	1.41	— 0.88

The estimation has been done as follows: The yield per acre which has been worked out as 0.43 tons, has been multiplied by the estimated acreage under cultivation. 2% of the total yield has been allowed for seeds. To work out the estimated consumption, 20.4 ounces have been taken as consumers unit per head, per day and 76% of the total population as adult units. By this method, the production in the State is estimated to be about 62.56 lakh tons whereas the consumption is estimated as 52.62 lakh tons, thereby resulting in a surplus of 9.94 lakh tons. Among the districts except Chingleput, Madras, Nilgiri and Kanyakumari, all other districts record surplus production, among which Coimbatore leads with 3.46 lakh tons of surplus. Other than Madras district, where production is negligible, Kanyakumari records a deficit of 0.88 lakh tons which is the highest among districts.

However, lest this data lead to any false sense of complacency, it may be mentioned that the total produce of 62.56 lakh tons includes every-

thing which comes under the Census definition of cultivation, and not limited to foodgrains alone. The yield of rice and millets alone for 60-61 (as per the State Season and Crop report) has been estimated as 52.03 lakh tons comprising 35.03 lakh tons of rice and 17.00 lakh tons of millets and other cereals. In the estimation from the particulars available from the Household Schedule, the acreage under current fallows also would be included, as no data relating to the current fallows are available in Household Schedule. This also to a certain extent would be responsible for the estimated production figure to be in excess of actual production.

#### Size class of land and production

80. The statement reveals the production under each size class and which of those size classes provide for markets after meeting the requirements of the households that produce them.

Size class of Land	Yield avail- able for consumption	Total consum- ption by cultivating households (In Lakh Tons)	Surplus or Deficit
All Sizes	62.56	25.69	+36.87
Less than 1 Ac.	1.01	3.80	— 2.79
1.0— 2.4	7.74	8.53	— 0.79
2.5— 4.9	12.16	6.51	+ 5.65
5.0— 7.4	10.47	3.22	+ 7.25
7.5— 9.9	4.96	1.08	+ 3.88
10.0—12.4	6.04	1.02	+ 5.02
12.5—14.9	2.09	0.29	+ 1.80
15.0—29.9	10.23	0.90	+ 9.33
30.0—49.9	4.25	0.21	+ 4.04
50 +	3.43	0.08	+ 3.35
Unspecified	0.18	0.05	+ 0.13

For the State as a whole about 25.69 lakh tons are consumed by the cultivating households themselves and about 36.87 lakh tons are available for others. Of this, the size classes upto 2.4 acres do not produce quantity sufficient even for those households and deficit to the tune of 3.58 lakh tons exists. 33.2% of the total

cultivating households are within this range. In other words, about one third of the total cultivating households in the State do not produce even for their consumption. All other size classes produce surplus of their requirements, the maximum being from the size class 15 to 29.9 acres which amounts to 9.3 lakh tons.

### Distribution of land

81. The following table gives the average area per head, per household and per cultivating household.

TABLE XII — 53

State/District	Average area (in acres)		
	Per head	Per household	Per cultivating household
<b>Madras State</b>	<b>0.45</b>	<b>2.05</b>	<b>4.56</b>
Chingleput	0.33	1.52	3.55
North Arcot	0.38	1.90	3.54
South Arcot	0.47	2.16	3.73
Salem	0.54	2.57	4.82
Coimbatore	0.61	2.78	8.47
Nilgiri	0.17	0.77	3.86
Madurai	0.43	1.98	4.74
Tiruchirapalli	0.60	2.62	4.57
Thanjavur	0.40	1.77	4.20
Ramanathapuram	0.59	2.62	4.46
Tirunelveli	0.43	1.90	4.46
Kanyakumari	0.13	0.64	1.64

For the State as a whole, the average area works out to less than half an acre per head, 2.05 acres per household and 4.56 acres per cultivating household. Among the districts, Coimbatore has the highest extent per head, per household and cultivating household and the lowest is in Kanyakumari. The districts when grouped with reference to the land held by cultivating households fall into four distinct groups. The cultivating households in Chingleput, North Arcot, South Arcot and Nilgiri held lands between 3 to 4 acres. In Salem, Madurai, Tiruchirapalli, Thanjavur, Ramanathapuram and

Tirunelveli, the cultivating households held lands between 4 to 5 acres. Coimbatore forms a separate category of highest acreage with 8.47 acres per cultivating household and Kanyakumari another separate category having the lowest viz., 1.64 acres. In Coimbatore each household has roughly doubled the acreage owned by similar households in other districts and in Kanyakumari cultivating households are not even having one third of the lands held by similar households in other districts. While in Coimbatore the phenomenal industrial growth may be the cause for the low pressure on land, it is the high density of households in Kanyakumari which is the chief cause for the small holdings. Besides the congestion of population in agriculture which has made the demand for land acute, the uneven distribution of land aggravates the problem in Kanyakumari.

### Size of holding

82. While recording the broad categories of rights over land, the enumerator was instructed to enter the extent of land held by each cultivating household. According to the instructions issued, the holdings as entered in the schedule need not represent the actual size of holdings as existed on ground. Different bits of land cultivated by households have been added and recorded in the household schedule against the 3 different categories (i) owned or held from Government (ii) held from private persons or institutions for payment in money, kind or share & (iii) land given to private persons for cultivation for payment in money, kind or share. Hence, the fragmentation of these holdings cannot be assessed. For the purpose of tabulation, the lands are classified as less than one acre, 1 to 2.4 acres, 2.5 to 4.9; 5.0 to 7.4; 7.5 to 9.9; 10 to 12.4; 12.5 to 14.9; 15 to 29.9; 30 to 49.9 and 50 and above.

In the State, maximum number of households are in the size class (i.e.) 1-2.4 acres. In the districts also the maximum percentage of cultivating households are in the size class range 1-2.4 acres except in Kanyakumari, Salem and Coimbatore. In Kanyakumari the maximum percentage of households are in the size class less than 1 acre, whereas Salem and Coimbatore have the maximum households under the size class

2.5 to 4.9 acres. More than half of the cultivating households (55.06%) in Kanyakumari own only less than one acre. This district reproduces the pattern of Kerala State of which it formed part till the reorganisation of States. Next to size class 1-2.4 acres, class range 2.5 to 4.9 has the highest percentage of households in all the districts with the exception of Tirunelveli. Tirunelveli has the highest percentage of households under "less than one acre" next to size class 1 to 2.4 acres. In general, we see marked changes in the distribution trends in Coimbatore and Kanyakumari from the rest of the districts. In Coimbatore the percentage of households in the lower size class (i.e.) below 10 acres is comparatively low and they are high in the size class 10 and above, while the trend for the State as a whole is reverse. In Kanyakumari almost all the households (98.52%) are under class range less than 10 acres. With the exception of these two districts and leaving Madras which is entirely an urban area the distribution of households under the different size class follows the same pattern in other districts with small marginal fluctuations.

### Rights in Land

83. The broad categories of rights or interests in land recorded in the schedule were classified as (i) households cultivating land owned or held from Government (ii) households cultivating land held from private persons for payment in money, kind or share and (iii) households cultivating land partly owned or held from Government, and partly from private persons for payment in money, kind or share.

The statement below gives the percentage of households in the rural areas of the State under each category.

State/ District	Percentage Households (Rural)		
	Owned or held from Government	Held from private persons	Both
Madras State	76.2	11.0	12.8
Chingleput	67.4	13.5	19.1
North Arcot	82.8	6.5	10.7
South Arcot	80.7	7.4	11.9
Salem	88.3	5.2	6.5
Coimbatore	79.8	10.4	9.8
Nilgiri	88.0	8.0	4.0
Madurai	79.3	9.1	11.6
Tiruchirapalli	77.7	8.9	13.4
Thanjavur	47.3	33.6	19.1
Ramanathapuram	77.7	7.4	14.9
Tirunelveli	77.1	9.6	13.3
Kanyakumari	63.0	13.4	23.6

Taking the cultivating households in the rural areas of this State, it is seen that 76.2% of the households cultivate land owned by them, 11% cultivate lands held under pure tenancy or crop sharing basis and the remaining 12.8% of households own lands under both. The highest percentage of households cultivating owned land is found in Salem, followed by Nilgiri and North Arcot. Thanjavur tops the list in having the highest percentage of households having tenancy cultivation followed by Chingleput and Kanyakumari. Mixed cultivation is found highest in Kanyakumari followed by Chingleput and Thanjavur.

The following Table presents the distribution of these three categories of households under different size classes.

TABLE XII — 54 A

Working Population

This distribution shows that in the category of land owned or held from Government and the category of land owned or held from private persons, etc. in the State, the distribution of households recedes after size class 2.4 acres, whereas in the category of land partly held from Government and partly from private persons the distribution shows an increase

upto 7.4 acres and then recedes. This indicates that many households acquire land on lease to consolidate their holdings and to make it a viable unit. The above table has been presented in another manner by showing the distribution of interests in land for every 1,000 households and for each size class of land.

TABLE XII -- 54 B

Working Population

**CHART 1.**  
**Cumulative Percentage of Cultivating Households**  
**and Area Cultivated in Madras State.**

**CHART 2.**  
**Cumulative Percentage of Households and Lands**  
**Owned in Madras State.**

CHART 3.  
Cumulative Percentage of Households and Land held from  
Private Persons or institutions in Madras State.

CHART 4.  
Cumulative Percentage of Households and Land Partly Owned  
and Partly held from Government in Madras State.

Three-fourths of the cultivating households in the State cultivate their own lands. Among the districts not much difference is noticed in the proportion of lands owned by households, except in Thanjavur, Kanyakumari and Chingleput. In these three districts, the proportion is lower than that of the State and it is the lowest in Thanjavur district. Other districts have less proportion under owner cultivation. Salem has the highest proportion of 88.21% of households cultivating land owned or held from Government. Availability of large tracts of land coupled with low literacy and non-availability of opportunities in other avocations may be the contributing factor. The proportion of land held from private persons is highest in this district and is nearly 3 times higher than that of the corresponding proportion in the State. Roughly one-third of the cultivating households here cultivate lands on some crop sharing or tenancy basis. Concentration of more lands in few hands seems to be the prime cause. Kanyakumari has the highest proportion under mixed tenancy. The acute pressure on land and the smallness of the holdings here makes them supplement the land owned with the land held from others.

#### Concentration of land

84. The cumulative percentage given below will indicate the concentration of land in a few households.

Cumulative Percentage		Madras State (Total)	
Size of land		Total cultivating households	
		Households	Area
Less than 1 Acre		14.80	1.62
Upto	2.4	48.01	14.00
	4.9	73.34	33.43
	7.4	85.86	50.17
	9.9	90.07	58.11
	12.4	94.03	67.76
	14.9	95.15	71.10
	29.9	98.66	87.45
	49.9	99.46	94.24
	50.1	99.80	99.71
	Unspecified	100.00	100.00

This statement has been presented in the form of a graph (chart 1).

85.86% of the households in the State cultivate land within 7.5 acres and they have 50.17% of the total cultivated land. About 5% of the households cultivate more than 15 acres, but they hold about 30% of the total area. The chart shows the skew distribution with the curve more in the class range upto 7.4 acres. The pattern in all the districts is almost the same.

The cumulative percentage of households having upto 7.4 acres in all the districts is presented below.

State/District	Cumulative Percentage Upto 7.4 acres	
	Total cultivating households	
	Households	Area
Madras State	85.86	50.17
Chingleput	90.91	60.28
North Arcot	91.64	66.84
South Arcot	89.72	57.71
Salem	84.71	55.60
Coimbatore	66.42	27.63
Nilgiri	90.26	60.35
Madurai	85.10	49.41
Tiruchirapalli	85.59	51.13
Thanjavur	88.50	55.13
Ramanathapuram	84.38	48.22
Tirunelveli	85.78	42.31
Kanyakumari	97.87	80.55

Of all the districts the holdings are the smallest in Kanyakumari. 97.87% of the households own less than 7.5 acres and the total extent owned by them is 80.55%. The remaining 2.3% own about 20.45% of the total land. Coimbatore shows a more equitable distribution with 66.42% of the households owning 27.63% of the area. The industrial growth in this district would have to a certain extent reduced the pressure on land.

**Households having owned lands**

85. Chart 2 shows the distribution of land owned in the different size classes for the State. 85.31% of the households in the State own lands within 7.5 acres amounting to 48.79% of the total area owned. While the average acreage

held by 85.31% of the households which are in the size class upto 7.4 acres comes to 2.67 acres, the remaining 14.69 of the households own per household an average of 16.07 acres. The statement below gives these particulars in respect of districts.

District	Below 7.5 acre			7.5 and above		
	Cumulative percentage of H. H.	Area	Average acreage per H. H.	Cumulative percentage of H. H.	Area	Average acreage per H. H.
1	2	3	4	5	6	7
Madras	N	N	N	N	N	N
Chingleput	80.88	56.11	2.35	10.12	43.89	15.50
North Arcot	91.32	65.39	2.58	8.68	34.61	14.06
South Arcot	89.22	56.33	2.40	10.78	43.67	15.34
Salem	84.78	55.33	3.16	15.22	44.67	13.99
Coimbatore	66.46	27.22	3.52	33.54	72.78	18.25
Nilgiri	90.35	60.95	2.58	9.65	39.05	15.73
Madurai	85.06	48.44	2.75	14.94	51.56	16.58
Tiruchirapalli	84.53	49.23	2.73	15.43	50.77	15.53
Thanjavur	90.19	56.70	2.62	9.81	43.30	16.40
Ramanathapuram	84.53	47.49	2.75	15.47	52.51	15.97
Tirunelveli	83.26	38.71	2.20	16.74	61.29	18.10
Kanyakumari	97.90	78.97	1.35	2.10	21.03	14.92

This again shows that vast areas of land are concentrated in a few hands. How far this situation has been changed by the Madras Land Reforms (fixation of ceiling on land) Act, 1961 and other land reforms can only be seen in the next Census.

**Households cultivating land held from private persons or institutions**

86. Chart 3 shows that the bulk of the pure tenancy holders are found in the size class range of less than 2.5 acres. About 68.33% of the households own less than 2.5 acres and 87.87% of the households own less than 5 acres. Only 3.52% of the cultivating households cultivate lands above 10 acres. The remarks of Sri Venkateswaran, the Superintendent of Census Operations in 1951 Census in his report regarding the tenancy cultivation is worth recapitulation

“In the Southern division, the most remarkable fact of course is that Thanjavur has got the smallest percentage under class I (owner cultivators) among the mufassal districts. That the more profitable the cultivation, the more the temptation to get the lands cultivated by others is borne out by the fact that among the mufassal districts in the southern division, Thanjavur has the smallest percentage under class I (37 per cent) while Chittoor (now in Andhra) and Ramanathapuram are at the opposite end with 70 and 71 per cent respectively”.

It is for the first time in Census history that extent of land held by the different pattern of households has been collected and therefore variation under the land held under lease during the decade could not be assessed accurately. However, a tangible amount of decrease in land held on lease and in general an improvement in peasant

proprietorship could be seen by comparing it with the following data obtained through National Sample Survey. According to the first report on the National Sample Survey, eighth round (1954), in South India, 23% of area under operation (by cultivating households) in the rural households was under lease. The results of the Census of land holdings and cultivation which was undertaken following the recommendation contained in the First Five Year Plan in this State in 1954 revealed that the area leased is only 11% of the area operated. But the wide variation between these data is mainly due to the differences in defining the term 'land held under tenancy'. Land held in urban area was outside the scope of this Census. The agricultural land was defined as the cultivated area comprised in a holding, including groves and pastures. For the purpose of these two enquiries, a tenant who has acquired permanent right has been regarded as owner, and therefore the area leased represents that portion of the area under tenancies in which permanent rights have not accrued to tenants. But the 1961 Census concept of land held under tenancy includes land held on lease even though the tenant has acquired permanent right. For exclusion from this category one must have proprietary right over land which is heritable and transferable.

### Land Reforms

87. It can be safely said that the extent of land held under the crop-sharing system or tenancy has been considerably reduced in the recent years thanks to the policy of the Government. The accepted policy since the advent of the National Government was to abolish all the intermediaries between the Government and the actual cultivator, to protect tenants by reducing or eliminating burdens he has borne in the past, to give the tiller of the soil his rightful place in the agrarian system and to provide him with fuller incentives for increasing agricultural production. So the last decade witnessed unprecedented measures on land reforms. A brief summary of the various land reforms passed in this State would be of use to appreciate the present position. The intermedia-

ries in the State have almost been abolished. The following statement will give the position as on 10-6-1962 (Fasli 1371).

	No. of estates	Area (Sq. miles)	Per- centage
1	2	3	4
Various types of intermediary tenures such as Zamindaris, Gajirs, inams before their abolition	6,360	13,003 (approximate)	100
Area of estates abolished	4,923	11,489	88.4
Area in which ryotwari settlement was introduced	4,872	11,187	..
Area in which ryotwari settlement is yet to be introduced	51	302	...
Area which has yet to be taken over	1,437	1,511 (approximate)	11.06

This has been achieved by the enactment of the Madras Estates (Abolition and Conversion into Ryotwari) Act, 1948 (Madras Act XXVI of 1948). It entitled the Government to take over by notification with effect from a specified date the Zamindari, an under-tenure or an inam estate. All ryots who possessed occupancy rights are granted ryotwari patta and the land-holders are granted ryotwari patta for the private lands under their personal cultivation. Provisions were made for payment of compensation for those who have interest in the acquired estates. After the enactment of 1948 Act, the only type of intermediary that remained to be abolished was post 1936 inams. The subsequent enactments were introduced in the Assembly during 1961 and 1962 to abolish 1936 inams. They have since been enacted. The Madras Iruvaram Inam Estates (Abolition and Conversion into Ryotwari) Act, 1963 abolished the Iruvaram Inam villages and the Madras Minor Inams (Abolition and Conversion into the Ryotwari) Act, 1962 abolished minor inams. There is yet another class of intermediaries in this State namely the lessees of leasehold villages and the Madras Leaseholds (Abolition and Conversion into Ryotwari) Act, 1962 makes

provision for the abolition and conversion of these villages into Ryotwari. Thus, all the intermediaries that existed in the State have been taken over by the Government, for conversion into Ryotwari area. But yet, sub-letting was not prevented. There was no legislation to prevent sub-letting. The question was examined in detail in 1951 by the Land Revenue Reforms committee and it recommended, that "it is not necessary or expedient to prohibit tenancy as such and the more important thing really is that equitable rights should be secured to tenants; if that is done it would not be imperative to prohibit tenancy altogether. We therefore recommend that the landlord and tenant system may be allowed to continue, but subject to the regulation of the system in respect of fair rents, security of tenure, compensation for improvements, grounds for eviction and other related matters." Consequently during the decade, several Acts regulating the tenancy were enacted. The Tanjore Tenants and Pannaiyal Protection Act, 1952 provided for the reinstatement of cultivating tenants who had been evicted by the land owner either in favour of other tenants or in favour of his own Pannaiyals. The Madras Cultivating Tenants Protection Act, 1955 protected the tenants from unjust eviction and provides for the restoration of a cultivating tenant to the land which he was in possession on 1-12-1953. Till 1956 there was no law in the State to regulate the rent payable by tenants to their land lords. The Madras Cultivating Tenants (Payment of fair rent) Act, 1956 fixes the fair rent as (i) Forty per cent of the normal gross produce in the case of wet land (ii) Thirty-five per cent of the normal gross produce in the case of wet land where the irrigation is supplemented by lifting water (iii) Thirty-three and one-third per cent of the normal gross produce in the case of any other class of land. The Tiruchirapalli Kaieruvaram and Mattuvaram Act, 1958 gives protection to Kaieruvaramdars and Mattuvaramdars found in Tiruchirapalli District.

These enactments have to a great extent ameliorated and improved the conditions of tenancy cultivators in this State.

### **Lands partly owned and partly held from Government**

88. As already mentioned, those who have not got sufficient lands to keep them and their cattle engaged fully find it necessary to supplement the lands already owned. It makes their holding a viable unit. The mildness of the skew, shows how in the lower size class, households try to have their holdings viable by resorting to taking land on lease. The distribution of these households in the different size classes in districts will confirm this. (i.e.) The percentage of households increases gradually upto size class 12.5 to 14.9 and then gradually recedes.

Districts in the descending order of concentration of these categories of households are :

1. Kanyakumari
2. Chingleput
3. Thanjavur
4. Ramanathapuram
5. Tirunelveli
6. Tiruchirapalli
7. South Arcot
8. Madurai
9. North Arcot
10. Coimbatore
11. Salem
12. Nilgiri

### **Cultivating households classified by number of workers**

89. Cultivating households have been grouped with reference to number of workers engaged as follows: (i.e.) 1, 2, 3-5, 6-10, more than 10 and unspecified. The following table presents the distribution of 1,000 households, 1,000 family workers and 1,000 hired workers in each size-class of land under cultivation of households.

TABLE XII-55 (Contd.)  
*Distribution of 1,000 households, 1,000 family workers, and 1,000 hired workers in each size class of land under cultivation of households, 1961*

	12. Unspecified	1,000	1,000	1,000	...	...	...	...	...	...

The number of households solely engaged in cultivation is higher under the group 3-5 persons. For every 1,000 households in the State, 306 households are in the group 3-5 persons and next come the group, with one person and two persons respectively. Among districts, Chingleput, South Arcot, Thanjavur, Tirunelveli and Kanyakumari differ from that of the State as a whole, and in these districts the proportion of households is highest under the group with one person. In Kanyakumari district, the proportion of households engaged in cultivation with one person is not only the highest but also more than double that of the corresponding proportion in the State.

It can also be seen that with the increase in size of land, the number of persons working increases. Under size class less than 1 acre, cultivating households with 1 person are highest, under size class 1.0-2.4 acres households with 2 persons, and under size class 2.5 and above, households with 3-5 persons are highest. In the households engaged both in cultivation and household industry in Kanyakumari district the proportion of households with one person ranks the lowest not only compared to the other groups but also compared to the other districts of the State. This again proves that not all the members of the household have enough work on land due to the smallness of the size of the land.

#### Workers in households classified by size classes

90. The average of total workers per household under the different size classes is as follows:

Size class (in acres)	Average of total workers per household
Less than one acre	2.15
1.0 to 2.4	3.06
2.5 to 4.9	4.23
5.0 to 7.4	5.22
7.5 to 9.9	6.10
10.0 to 12.4	6.34
12.5 to 14.9	7.26

Size class (in acres)	Average of total workers per household
15.0 to 29.9	7.81
30.0 to 49.9	9.79

A rough idea of under-employment can be had from the number of persons employed and the size class of the land. For this purpose, households which have more than two persons working in less than one acre, more than 6 in 1 to 7.4 acres and more than 10 in 7.5 to 49.9 acres have been taken to be the households in which persons are under-employed. The norm fixed is of course only arbitrary.

State/District	Less than one acre (% households in which more than 2 workers engaged)	1.0-7.4 acres (% households in which more than 6 workers engaged)	7.5-49.9 acres (% households in which more than 10 workers engaged)
Madras State	21.1	13.57	14.26
Madras	...	...	...
Chingleput	20.4	15.20	18.86
North Arcot	23.1	11.27	11.54
South Arcot	22.2	16.37	21.48
Salem	23.2	14.77	15.94
Coimbatore	16.6	7.27	10.08
Nilgiri	24.4	15.43	29.44
Madurai	22.4	13.83	14.84
Tiruchirapalli	28.5	18.87	18.26
Thanjavur	17.7	13.77	21.66
Ramanathapuram	24.0	11.43	12.82
Tirunelveli	17.1	6.97	5.70
Kanyakumari	11.2	18.70	29.06

Under size class less than one acre, for the State as a whole, 21.1% of the households employ more than 2 persons. Among the districts, Tiruchirapalli and Nilgiri have the highest percentage of households having 3 and more than 3 persons.

followed by Ramanathapuram. In the districts of Nilgiri and Tiruchirapalli, vegetable cultivation is widely practised which requires constant care and it normally requires more persons than other types of cultivation. But the position in Ramanathapuram district seems to indicate under-employment. 24% of the households under this size class have 3 and more workers per household.

In the size class 1 to 7.4 acres 13.57% of the households engage more than the maximum of 6 workers per household. It is highest in Kanyakumari, followed by Tiruchirapalli and South Arcot. In the size class 7.5 to 49.9 acres, Nilgiri, Kanyakumari and Thanjavur have the highest percentage of households having more than the normal maximum.

The lowest percentage of households employing more than 3 persons in size class less than an acre is found in Kanyakumari, and Tirunelveli has the lowest percentage under the other two size classes.

As regards the proportion of hired workers under the various working groups, it is highest

under "more than 10 persons". The proportion of hired workers increases with the increase of working strength. The proportion of family workers is highest in the group 3-5 persons in all classes except that of less than one acre. It is difficult to gauge the extent of under-employment without further details about the nature of work done, number of hours, the cropping pattern, the irrigation facilities, etc. The above analysis should only be taken as a rough estimation of under-employment.

#### Combination of cultivation and household industry

91. Few households engaged in cultivation practise household industry along with cultivation. The combination of households with cultivation and/or household industry is found highest in Kanyakumari followed by Tirunelveli and Coimbatore. In all other districts, the proportion of these households is less than that of the State figure of 55 per thousand.

The following statement shows the distribution of households solely engaged in cultivation and engaged both in cultivation and household industry for the State under the different size classes.

TABLE XII—56  
*Distribution of 1,000 households engaged both in cultivation and household industry showing size of land cultivated*

State District	Households engaged both in cultivation and household industry	Distribution of the households by size of land cultivated										
		Less than 1 acre	1.0—2.4	2.5—4.9	5.0—7.4	7.5—9.9	10.0—12.4	12.5—14.9	15.0—29.9	30.0—49.9	50+	
1	2	3	4	5	6	7	8	9	10	11	12

Thanjavur	1,000	296	397	189	72	18	14	3	8	1	2	
Ramanathapuram	1,000	181	353	252	106	40	29	8	20	6	2	
Tirunelveli	1,000	346	332	175	74	18	20	7	20	4	2	
Kanyakumari	1,000	689	241	51	13	3	2	...	N	N	1	

90% of the households engaged both in cultivation and household industry in the State are in the size class upto 7·4 acres. It shows how the households in the lower size class try to supplement their income by having cultivation or household industry as their secondary occupation. Compared with the households solely engaged in cultivation, households engaged both in cultivation and household industry are more concentrated in

the size class upto 2·4 acres and less in the other size classes. Normally, households with less extent of land supplement the income through other work.

The following table presents the distribution of 1,000 households, 1,000 family workers and 1,000 hired workers in each size class of land for households engaged both in cultivation and household industry.

TABLE XII—57

	12. Unspecified	...	...	...	...	...	...				

In the case of such households also the maximum number of households are found in the group 3-5 persons.

#### **Role of Scheduled Castes and Scheduled Tribes**

92. The proportion of Scheduled Caste and Scheduled Tribe population is 19% among males and 19% among females. Among the male and female workers, the Scheduled Caste and Scheduled Tribe males and females form 20% and 27% respectively. The Scheduled Caste and Scheduled Tribe workers form the highest proportion in the category of agricultural labourers as compared to that of cultivators and workers in mining, quarrying. In most of the

districts of the State also, the same pattern prevails.

It can be seen from the following Tables that the proportion of Scheduled Castes and Scheduled Tribes population among cultivating households is highest in the case of land owned or held from private persons both in the State and in all districts, except in Nilgiri district. It can also be seen that the proportion is highest in the case of lands of 1-2.4 acres whatever may be the nature of interest in land.

Further detailed analysis of Scheduled Castes and Scheduled Tribes population and workers will be found in the volume on Scheduled Castes and Tribes (Part V-A).

TABLE

## Part—E

## Workers at Household Industry

**General**

93. This part deals with the population engaged in household industry. The concept of worker at household industry was introduced in the 1961 Census to ascertain the extent of participation of population in industries which are not run on regular established lines but mainly run on household basis and which are important so far as the production of economic goods for local consumption is concerned. Information of persons engaged in household industry was collected from two separate sources: (1) from the Individual Slips and (2) from the Household Schedule.

**Definition**

94. Household Industry was defined as an industry conducted by the head of the household himself and/or by the members of the household at home or within the village in rural areas and only at home in urban areas. The industry should not employ more than 20 persons if power is not used and more than 10 persons where some kind of power is used. Further, the household industry should be engaged in the production of goods, processing or servicing and may include sale but should not purely engage itself in purchase and sale.

**Difference between data collected from Household Schedule and Individual Slip**

95. While recording information of persons working in household industry in the Individual Slips, the criteria was whether the person was engaged in household industry or not. Even if a person was engaged in an household industry conducted by another household of which he was not a member, the nature of work he was doing and the nature of the industry in which he was engaged was recorded. While preparing the Household Schedule the individual working in another household conducting household industry would not be shown as working in the household industry.

The classification made from the information furnished in the individual slip relates to principal work. In the case of Household Schedules, the main purpose was to find out the extent of participation by households in the twin economic fields of household cultivation and household industry, even of secondary importance. In the case of persons engaged in household industry and cultivation, the Household Schedule would show them as engaged in both, while in the individual slip they may be shown against either. It therefore stands to reason that the figures collected from the Household Schedules would be higher than those arrived at from the Individual Slips. It is also probable that the enumerator might have returned an individual against Q. 11—Non-household industry instead of under Q. 10—Household industry.

 H. W.—Hired Worker

The instructions to the enumerators for recording answers to the questions on Household industry in the Individual Slip and Household Schedule have been reproduced elsewhere.

#### Tables dealing with household industry

96. Out of the tables based on individual slip, only one main table namely, B-IV-Part A deals exclusively with workers at household industry. In the other main tables, excluding the two tables of B-VIII and B-IX which deal only with non-workers, data relating to Household Industry are given along with figures for other categories.

Following main and subsidiary tables relate to workers at household industry :

#### Tables based on Individual Slip

B-I	Workers and non-workers classified by sex and broad age-groups.
B-II	Workers and non-workers in cities, town-groups and towns arranged territorially classified by sex and broad age groups.
B-III	Parts A & B—Industrial classification of workers and non-workers by educational levels in urban and rural areas.
B-IV	Part A—Industrial classification by sex and class of worker of persons at work at household industry.
B-V	Occupational classification by sex of persons at work other than cultivation.
B-VII	Part A—Persons working principally (i) as cultivators, (ii) as agricultural labourers or (iii) at household industry, classified by sex and by secondary work (i) at household industry (ii) as cultivator or (iii) as agricultural labourer.  Part B—Industrial classification by sex of persons working in non-household industry, trade, business, profession or service who are also workers engaged in household industry.

#### Tables based on Household Schedule (Based on 20% sample)

B-X	Sample households (i) engaged neither in cultivation nor household Industry, (ii) engaged either in cultivation or household industry but not in both and (iii) engaged both in cultivation and household industry for all areas.
B-XIII	Sample households engaged both in cultivation and household industry showing size of land cultivated classified by principal household industry in rural and urban areas separately.
B-XIV	Sample households engaged only in household industry classified by principal household industry in all areas. Part A—Households classified by major groups of principal household industry and number of persons engaged. Part B—Households classified by minor groups of principal household industry.
B-XV	Sample households engaged both in cultivation and household industry classified by size of land in rural and urban areas separately.
B-XVI	Sample principal household industry classified by period of working and total number of workers engaged in household industry in all areas

#### Tables for Scheduled Castes and Scheduled Tribes

C-VIII	Part A—Classification by literacy and industrial category of workers and non-workers among Scheduled Castes. Part B—Classification by literacy and industrial category of workers and non-workers among Scheduled Tribes.
SCT-I	Part A—Industrial classification of persons at work and non-workers by sex for Scheduled Castes.  Part B—Industrial classification of persons at work and non-workers by sex for Scheduled Tribes.

**Subsidiary Tables**

- B-I. 1** Distribution of 1,000 persons by each industrial category of worker and by non-worker and by sex.
- B-I. 2** Number of female workers per 1,000 male workers in each industrial category.
- B-I. 3** Distribution of 1,000 of total workers of each sex into age-groups and industrial categories.
- B-I. 4** Distribution of 1,000 workers in each sex and each industrial category by age-group.
- B-I. 5** Workers per 1,000 population in each age-group.
- B-I. 6** Workers per 1,000 population in each Censuses, 1901-1961.
- B-II. 1** Distribution of 1,000 workers in each class of town by age, sex and industrial categories.
- B-II. 2** Distribution of 1,000 workers in each city or town-group with a population of one lakh and over by age, sex and industrial categories.
- B-II. 3** Workers per 1,000 population in each city and comparison of workers in industrial categories from 1901-1961.
- B-III** Part-A. 1—Distribution of 1,000 workers in each sex by educational levels in urban areas only.  
Part-A. 2—Distribution of 1,000 workers in each industrial category and in each sex by educational levels in urban areas only.  
Part-A. 3—Distribution of 1,000 persons not at work by educational levels in urban areas only.
- B-IV. 3** Number per 1,000 workers at industrial category IV—Household Industry—who are employees and others.
- B-V. 1** Distribution of 10,000 workers other than those working as cultivators or as agricultural labourers by occupational division, group and family of National Classification of Occupations.
- B-VII** Part-A. 1—Number per 1,000 persons working principally as cultivators, who are working (1) as cultivators and agricultural labourers, (2) as cultivators and at household industry in rural areas only.  
Part-A. 2—Number per 1,000 persons working principally as agricultural labourers, who are working (1) as agricultural labourers and cultivators, (2) as agricultural labourers and at household industry in rural areas only.  
Part-A. 3—Number per 1,000 persons working principally at household industry, who are working (1) at household industry and as cultivators, (2) at household industry and as agricultural labourers.
- B-X. 1** Distribution of 1,000 sample households (i) engaged neither in cultivation nor household industry, (ii) engaged either in cultivation or household industry but not in both and (iii) engaged both in cultivation and household industry for all areas.
- B-XIV** Part-A. 1—Distribution of 1,000 sample households engaged in household industry only by principal household industry and working strength in all areas.  
Part-B. 1—Distribution of 1,000 sample households engaged in household industry only by principal household industry (Division / Major / Minor Groups) in all areas.
- B-XVI. 1** Distribution of 1,000 sample households engaged in household industry (with and without cultivation) by principal household industry in each duration.

- B-XVI. 2** Distribution of 1,000 sample household workers engaged in principal household industry (with and without cultivation) by family and hired workers in each duration.
- B-XVI. 3** Average number of family and hired workers per household engaged in principal household industry (with and without cultivation) by the duration of household industry in rural and urban areas.
- C-VIII** **Part-A. 1**—Distribution of 1,000 persons of all Scheduled Castes by sex and literacy.
- Part-A. 2**—Distribution of 1,000 persons of all Scheduled Castes by categories of workers and non-workers.
- Part-B. 1**—Distribution of 1,000 persons of all Scheduled Tribes by sex and literacy.
- C-VI** **Part-B. 2**—Distribution of 1,000 persons of all Scheduled Tribes by categories of workers and non-workers.

#### Workers at household industry

97. 1,206,812 persons are engaged in household industry. The sex-wise break-up is 681,052 males and 525,760 females. Persons engaged in household industry form 3.58% of the total population. Males working at household industry form 4.03% of all males and females form 3.13% of all females.

Out of 1,206,812 persons engaged in household industry, 827,244 are found in rural areas and 379,568 persons in urban areas. In terms of percentage, 68.55% are in rural sector and 31.45% are in urban sector.

#### Workers in household industry computed from the individual slip and household schedule

98. The number of workers engaged in household industry have been ascertained from the individual slip as well as from the household schedule. The table below gives the figures collected from the two sources.

TABLE XII—62

Workers at household industry recorded in the individual slip and those recorded in the household schedule, 1961

State; District	Total Population			Family workers and employees at household industry (Table B-1)			Workers at all household industries with or without cultivation (Table B-XVI)

Note: Figures given in cols 8, 9 and 10 have been arrived at by multiplying the figures in Table B-XVI by 5 as they are based on a 20% sample.

F.W.—Family workers  
H.W.—Hired workers

**Workers at household industry compared with the workers in other industrial categories**

99. The table presented below shows the proportions of workers classified by sex and broad age-groups in household industry and those working

as cultivators, agricultural labourers, in manufacturing other than household industry and other services. The proportions have been given for total, rural and urban areas of the State and districts.

The age-groups adopted represent the following stages in the life of an individual—childhood, working age-group and old age.

Much higher participation of males in the workers' group is seen among all the age-groups and in all the three sectors—total, rural and urban. The predominance of cultivation and agricultural labour in the economic life of the State and especially in villages is clearly seen from the figures presented above. Household industry is less prominent in the villages than in the urban parts contrary to what one might expect. In the towns, non-household industry and other services assume much greater importance than in the villages.

Women's participation rate compares favourably with those of men's in the categories agricultural labourers and at household industry in the rural and urban sectors, mainly because, to maintain the household both the sexes have to work if they are engaged in either of these activities. In the other categories, one can see the supremacy of males in the rural and urban areas which is a natural phenomenon on account of difference in the educational levels of the sexes, physical strain and the question of movement from place to place involved in pursuing these avocations.

### Working children

100. Persons in the age group 0-14 are generally children of the school going age. The proportion of children in the school going age attending to studies will be indicative of the future growth and prosperity of a nation. Our nation is predominantly agricultural and has not reached a higher level of economic prosperity in industrial field. It is possible therefore that even children in the school going age will be driven to the necessity of earning a few rupees to augment the family income. From the figures presented above, we may be able to infer the effect of the withdrawal of children in the school going age from education.

At the State level, out of 1,000 persons of each sex in the age group 0-14, 93 males and 67 females are workers in all areas. The proportions increase to 111 for males and 82 for females in the rural sector while in the urban sector the proportions are 44 for males and 28 for females. In the villages, employment of children

is greater in cultivation and agricultural labour than in the other categories. Conversely in the urban areas, greater employment of children is seen under non-household industry (manufacturing), household industry and other services as compared to cultivation and agricultural labourer. In the rural areas, more boys than girls are employed in cultivation, agricultural labour and non-household industry. In the case of household industry and other services, the proportions of both the sexes are equal. In the urban sector, the proportions of males are higher in all the categories except household industry. In the case of household industry, more girls than boys are employed.

A fairly higher proportion of workers in both the sexes in this age-group is seen in the rural areas of Salem, Coimbatore and Tiruchirapalli. The lowest proportion of child workers is seen in Kanyakumari. In the urban sector, Salem, Ramanathapuram and Tirunelveli show higher proportions for both the sexes. The lowest proportions are to be seen in Madras. Nizhams, Thanjavur and Kanyakumari also show lower proportions. North Arcot has shown higher proportion for males.

### Working age-group population

101. For every 1,000 persons of each sex in the age-group 15-34, 885 males and 457 females are workers at the State level. The proportions rise to 924 and 551 respectively in the rural areas and decrease to 788 and 208 respectively in towns and cities. Lesser proportion of population seems to be employed in the urban sector consequent on the better economic standard of urban families. In the next higher age-group of 35-59 we find the highest proportions of workers, 966 males and 514 females out of 1,000 persons of each sex are workers in the State as a whole. 978 males and 590 females are workers in rural areas as against 924 males and 275 females in the urban sector. The prominence of this age-group in the proportions of workers of both the sexes is natural. Predominance of males is to be seen in both the sectors. Even though much difference is not seen in the proportions of workers between the rural and urban sectors for males, wide variation is seen in the proportions of females who are workers in the two sectors.

**District-wise analysis of 15-34 age-group workers**

102. Highest proportion of male workers in the rural sector for the age-group 15-34 is seen in Salem where the proportion is 951. North Arcot, South Arcot, Coimbatore, Madurai and Tiruchirapalli have also recorded higher proportions ranging from 930 to 938. Lowest proportion of 821 is seen in Kanyakumari and is followed by Nilgiri with 894. For females, the highest proportion of 713 is seen in Nilgiri and the lowest in Kanyakumari with 288. North Arcot, Salem, Coimbatore, Madurai, Tiruchirapalli, Ramanathapuram and Tirunelveli have also higher proportions of female workers.

In the urban sector, the highest proportion under males is seen in Salem (841) and the lowest in Kanyakumari (730). Coimbatore, Nilgiris, Madurai, North Arcot, Ramanathapuram and Tirunelveli have also higher proportions of workers. In respect of females, the highest proportion of 425 is seen in Nilgiri and the lowest proportion of 84 in Madras. Salem, Coimbatore, Madurai, Ramanathapuram and Tirunelveli have recorded higher proportions.

**District-wise analysis of 35-59 age-group workers**

103. When looking into the proportions of workers in the age group 35-59 in the rural sector, the highest and lowest proportions for males are to be seen in Salem and Kanyakumari with 984 and 972 respectively. North Arcot, South Arcot, Madurai and Tiruchirapalli show higher proportions. Among females, the highest proportion of 748 is seen in Nilgiri and the lowest in Kanyakumari with 324. North Arcot, Salem, Coimbatore, Madurai, Tiruchirapalli, Ramanathapuram and Tirunelveli have recorded higher figures than the State average.

In the urban sector, among males, highest proportion of 955 is seen in Nilgiri and the lowest in Madras, with 915. South Arcot, Coimbatore, Salem and Tirunelveli have recorded higher proportions. Among females, the highest proportion of 493 is to be seen in Nilgiri and the lowest in Madras with 132. Salem, Coimbatore, Madurai, Ramanathapuram and Tirunelveli have also higher figures.

Generally, we find higher proportions of workers in the southern and western districts.

Kanyakumari in the rural sector and Madras in the urban sector show lowest proportions. Kanyakumari has a higher literacy level and reflects the pattern in Kerala. In the case of Madras, it is a metropolitan city with varied activities. The households are economically better placed.

In the districts where cultivation and household industry are main activities or where manufacturing and household industry are prominent, we can see a higher proportion of workers in both the sexes. In the districts which do not have these industrial activities to any great extent and have a higher level of literacy rates, the proportion of workers tends to be less as in the case of Kanyakumari and the City of Madras.

**Districts having predominant household industry workers**

104. Certain special features in respect of workers in household industry are given below. The rural areas of Coimbatore, Tirunelveli and Kanyakumari show higher figures in household industry than the other districts in both the sexes. In the latter two districts, female proportions are much higher than males. Kanyakumari is unique in that the highest proportion of female workers is shown by household industry. In Tirunelveli, the female proportions under Household Industry exceed those under other services.

In the urban sector, Chingleput, North Arcot, Salem, Ramanathapuram and Tirunelveli record higher proportions than other districts in respect of workers under household industry in both the sexes. In Kanyakumari, while males record lesser proportions than the State average, the proportions under females are much higher. Salem has recorded the highest proportions in both the sexes relegating other services to the second place. In the districts of Ramanathapuram, Tirunelveli and Kanyakumari, the female proportions are higher than those shown by males.

Coimbatore and Kanyakumari rural areas show higher proportions for both the sexes compared to those shown by urban areas.

**Workers at household industry, cultivation and in manufacturing other than household industry by educational levels**

105. Union Table B-III Part A gives the urban population in each industrial category of workers and non-workers of each sex classified

by educational levels. From the figures presented in the table, the distribution of 1,000 workers in each sex in the categories of cultivation, household industry and manufacturing other than household industry into educational levels is given below :

TABLE XII—64

At the State level, among the three industrial categories shown above, illiterates form a higher proportion in both the sexes in the category of cultivator. Illiterates among female workers show a lesser proportion in category IV—household industry. Simple literates without educational level have a higher proportion in category IV—household industry. Compared to the other two categories, category V—manufacturing other than household industry has a higher proportion of workers of both the sexes in all higher educational levels beginning with Primary or Junior Basic. The proportion of workers with educational level Matriculation and above is considerably less in both the sexes in household industry.

This table would indicate that more literates are to be seen in manufacturing other than household industry when compared with the other two categories because these two industrial categories do not require much education and that these occupations are conducted on a hereditary basis.

#### **Educational levels of workers in cultivation, household industry and manufacturing in rural sector**

106. Earlier, we have discussed the educational attainments of workers in certain categories in the urban sector. The attainments of rural workers will be examined now

570 males out of 1,000 males engaged in cultivation are illiterates. The proportions in household industry and manufacturing other than household industry are 534 and 383 respectively. 953 females out of 1,000 are illiterates among cultivators. 843 and 879 out of 1,000 each are illiterates among workers engaged in household industry and manufacturing other than household industry respectively. While among males,

lowest proportion of illiterates is seen under manufacturing, among females household industry shows the lowest proportion. Highest proportion among workers who are literates without educational level is seen among males under manufacturing, and among females under household industry. In the other higher educational levels, among males, highest proportion is seen under manufacturing. Among females, the highest proportion of Primary or Junior Basic level persons is seen under household industry and the highest proportion of Matriculation and above qualified persons is seen under manufacturing other than household industry.

In the rural areas, male workers in manufacturing are better qualified and among females, workers in household industry are better qualified.

#### **Persons having principal work in non-household industry, trade, profession or service and having secondary work in household industry**

107. Table B-VII Part B gives the number of persons of each sex who are having principal work in non-household industry etc. and have secondary work in household industry also.

Out of a total of 4,858,602 persons whose principal work is non-household industry, trade, business, profession, service, etc. 5.064 have secondary work in household industry. Only 0.10% are having secondary work in household industry. Among males, the percentage is 0.10 and among females, the percentage works out to 0.11.

The following table shows the total workers in each industrial category, the number of persons having secondary work and the percentage of workers having additional work in household Industry to total of its category.

TABLE XII—65

*Percentage of workers with additional work at Household Industry*

Principal work (Industrial category)	Total Workers			Workers with additional work at Household Industry			Percentage to Total		
	P	M	F	P	M	F	P	M	F
1	2	3	4	5	6	7	8	9	10
Total III to IX	4,858,602	3,747,205	1,111,397	5,064	3,877	1,187	0·10	0·10	0·11
III	435,498	330,606	104,892	1,047	954	93	0·24	0·29	0·09
V	848,302	750,585	97,717	376	282	94	0·04	0·04	0·10
VI	205,327	175,937	29,390	267	197	70	0·13	0·11	0·24
VII	758,301	660,894	97,407	952	784	168	0·13	0·12	0·17
VIII	253,601	248,599	5,002	171	124	47	0·07	0·05	0·94
IX	2,357,573	1,580,584	776,989	2,251	1,536	715	0·10	0·10	0·10

It is to be seen that secondary work at household Industry is considerably less in respect of persons whose principal work falls in non-household industry, trade, business, profession or service. Secondary work in household industry is taken up only when the principal work does not engage the full time of the workers and where

the income from principal work is not enough to maintain a person and his family and also where the secondary work is ancillary or a complement to the principal work.

The following distribution table has been prepared for the State as a whole from Table B-VII Part B.

### **Principal work in agriculture, livestock, forestry, fishing and hunting**

108. For those engaged in agriculture, forestry, fishing and hunting, secondary work is mainly in manufacturing of cotton textiles, food processing industries, miscellaneous textiles, and manufacture of wood and wooden products and in livestock rearing and hunting. Females are prominent in livestock rearing, in the manufacture of miscellaneous textile goods and in the manufacture of wood and wooden products.

### **Principal work in manufacturing**

109. Livestock rearing and hunting, food processing industries, cotton textiles manufacture, miscellaneous textiles making and manufacture of wood and wooden products are prominent additional items of work for persons whose principal work is in manufacturing. Female workers are prominent in livestock rearing and hunting, in manufacture of cotton textiles and manufacture of tobacco products.

### **Principal work in construction**

110. For those engaged principally in construction, cotton textiles manufacture, manufacture of wood and wooden products, manufacture of non-metallic mineral products (manufacture of bricks, tiles, earthenware, glasswares etc.) and livestock rearing and hunting are prominent additional items of work. Females are prominent in livestock rearing and hunting and in the manufacture of cotton textiles and wood and wooden products. In the manufacture of non-metallic mineral products males are very prominent.

### **Principal work in electricity, gas, water and sanitary services**

111. Prominent items of additional work are manufacture of wood and wooden products, leather and leather products, manufacture of cotton textiles, food processing industries and livestock rearing and hunting. For females, food processing industries, cotton textiles making and manufacture of wood and wooden products are important items of secondary work.

### **Principal work in trade and commerce**

112. For those mainly engaged in trade and commerce, the chief items of secondary work are manufacture of food stuffs, textiles, cotton, wood and wooden products, miscellaneous textile goods and livestock rearing and hunting. Females are prominent in livestock rearing and hunting, food processing industry and manufacture of wood and wooden products.

### **Principal work in transport**

113. Chief items of secondary work are livestock rearing and hunting, manufacture of cotton textiles, wood and wooden products, manufacture of non-metallic mineral products and miscellaneous manufactures. Females are prominent in cotton textiles manufacture.

### **Principal work in other services**

114. Chief items of secondary work are manufacture of wood and wooden products, cotton textiles, foodstuffs, leather and leather products and livestock rearing and hunting. Females are prominent in the food processing industries and in cotton textiles manufacture.

It may be seen from the above that the secondary work is not very important to persons whose principal work is non-household industry, trade, business, profession or service. The secondary work taken up by them is such that it can be undertaken without much labour and does not require specialised knowledge and skill. Female participation is more in industries which can be done in and around their homes without much labour on their part and not requiring extra skill. Males are prominent in items of work where more manual labour and skill is required.

### **Distribution of households by participation in cultivation and household industry**

115. Union Table B-X classifies the 20% sample households according to their engagement in cultivation or household industry or in both. The table given below gives the distribution of 1,000 sample households according to their engagement. The households which are neither engaged in cultivation nor in household industry are also given.

TABLE XII—67

		U	1,000	765	129	94	12

At the State level in all areas, 424 households out of 1,000 are engaged in cultivation only, while 62 are engaged in household industry only. 25 out of 1,000 households do practise cultivation along with household industry. In the rural areas 544 out of 1,000 households are participating in cultivation only and 55 are engaged in household industry only. In the urban sector 81 households are engaged in cultivation only and 83 are engaged in household industry only. While in rural sector 32 households out of 1,000 are engaged both in cultivation and household industry, only 5 out of 1,000 are so engaged in the urban sector. This table indicates the prominence of cultivation and cultivation combined with household industry in the rural sector. In this State, more households are practising household industry in the urban areas compared to rural sector and that the combining of the two economic activities of cultivation and household industry is relatively easier in rural than in the urban areas.

#### **Households engaged in household industry only**

116. Averages for the State as a whole in total, rural and urban sectors show significant differences. While the rural proportion is comparable with the total, urban proportion is higher indicating prevalence of household industry more in urban sector. The averages for total and rural are higher than the State average in the districts of Salem, Coimbatore, Tirunelveli and Kanyakumari. The urban average of 83 households per 1,000 is exceeded in Chingleput, North Arcot, Salem, Ramanathapuram, Tirunelveli and Kanyakumari.

#### **Households combining cultivation and household industry**

117. The State average for the three sectors is significantly different. There appears to be complete absence of these combined economic activities in urban households. As such, a low proportion of 5 households is seen. The total and rural averages in the districts of North Arcot, Salem, Coimbatore, Tirunelveli and Kanyakumari exceed those for the State. The urban

averages in the districts of Salem, Tirunelveli and Kanyakumari are much higher than the State average.

Household industry is of some significance in the districts of North Arcot, Salem, Coimbatore, Tirunelveli, Ramanathapuram and Kanyakumari. North Arcot and Tirunelveli have leather tanning, beedi rolling and handlooms as the chief household industries. In Salem and Coimbatore, textile manufacture in handlooms is the chief household industry. In Ramanathapuram, in addition to handloom textiles match industry is prominent.

Out of 125,871 sample households engaged in household industry with or without cultivation, 92,945 or 73.84% are in rural areas. Among households engaged purely in household industry, 58,884 out of 89,921 (65.48%) are located in rural sector. Out of 35,950 households engaged in household industry along with cultivation, 34,061 or 94.75% are in rural areas.

Out of 92,945 households engaged in household industry with or without cultivation in rural areas, 58,884 are engaged in household industry only. The percentage of such households works out to 63.35% and 34,061 households or 36.65% are engaged in household industry along with cultivation. In the urban sector, out of 32,926 households engaged in household industry with or without cultivation, 31,037 or 94.26% are engaged in household industry only and 1,889 or 5.74% are engaged in household industry with cultivation. From the above, it may be seen that in the rural sector households engaged in household industry will not be able to maintain itself solely on this vocation and that it has to take some other activity, viz. cultivation, to maintain economic self-sufficiency. In the urban sector, households engaged in household industry may be able to maintain itself mainly on the industry conducted and that the absence of facilities for cultivation forces the households to stick to the industry. The low percentage of combined households in urban sector may also be due to the households engaging themselves in activities other than cultivation to maintain themselves. Which of the two factors operate in the urban households is not clear due

to the absence of data, particularly of households practising household industry along with some activity other than cultivation.

#### Nature of household industry

118. The table below shows the distribution of

20% sample households according to the broad classification of industries in which they are engaged. For easy reference, percentage figures are also given. Rural and urban figures have also been presented.

TABLE XII—68

	R	3,536	254	1	3,281	7.18	0.03	92.79
	U	3,144	29	...	3,115	0.92	...	99.08
Tirunelveli	T	14,490	934	3	13,553	6.45	0.02	93.53
	R	8,806	812	3	7,991	9.22	0.03	90.75
	U	5,684	122	...	5,562	2.15	...	97.85
Kanyakumari	T	5,614	417	...	5,197	7.43	...	92.57
	R	5,071	410	...	4,661	8.09	...	91.91
	U	543	7	...	536	1.29	...	98.71

From the above statement, it may be seen that households engaged in industrial divisions 2-3 viz., manufacturing, are predominant in the State and districts as compared to those in industrial division 0 - agriculture, livestock, forestry, fishing and hunting and division 1 - mining and quarrying. From the percentage figures, it is to be seen that 95.55% of households come under manufacturing and primary industries connected with agriculture, livestock, etc. having a percentage of 4.44. Households coming under the industrial division 1 - mining and quarrying is almost insignificant and indicates the unpopularity of this branch of industry to be practised as household industry. Practically almost all the households are engaged only in manufacturing industries in the urban areas of the State in as much as 98.34% of the households come within Divisions 2-3. The households engaged in agriculture, livestock etc. show only a percentage of 1.66. Even in the rural areas, percentage of such households does not exceed 6. This clearly indicates the preference for manufacturing industries rather than the production of goods by the primary industries of agriculture, livestock, fishing, etc. in the State.

The number of rural households having household industries exceeds that of the urban sector in the State and all the districts except Nilgiri, Madurai and Ramanathapuram. In the first two districts mentioned above, urban households exceed those of the rural sector. In the last district, the number of urban households nearly equals that of the rural sector.

In the rural sector, the percentage of households having industries connected with agriculture, livestock, etc. is higher than the average for the State in the districts of North Arcot, South Arcot, Nilgiri, Tiruchirapalli, Thanjavur, Rama-

nathapuram, Tirunelveli and Kanyakumari. The lowest percentage of such households is to be seen in Salem and is followed by Chingleput and Coimbatore. In the urban sector, the State average is exceeded in the districts of South Arcot, Coimbatore, Nilgiri, Madurai, Tiruchirapalli, Thanjavur and Tirunelveli. The lowest percentage is seen in Chingleput and Salem.

Primary industries connected with livestock rearing and agriculture are the main types found in the above districts. In Thanjavur, Ramanathapuram and Kanyakumari, fishing also contributes to the higher percentage of such households. Even in urban areas of these districts, livestock rearing is of importance. Salem's prominence in the manufacture of handloom textiles, a prominent household industry, is well reflected by the highest percentage of households coming under Divisions 2-3 manufacturing, to the complete exclusion of primary industries.

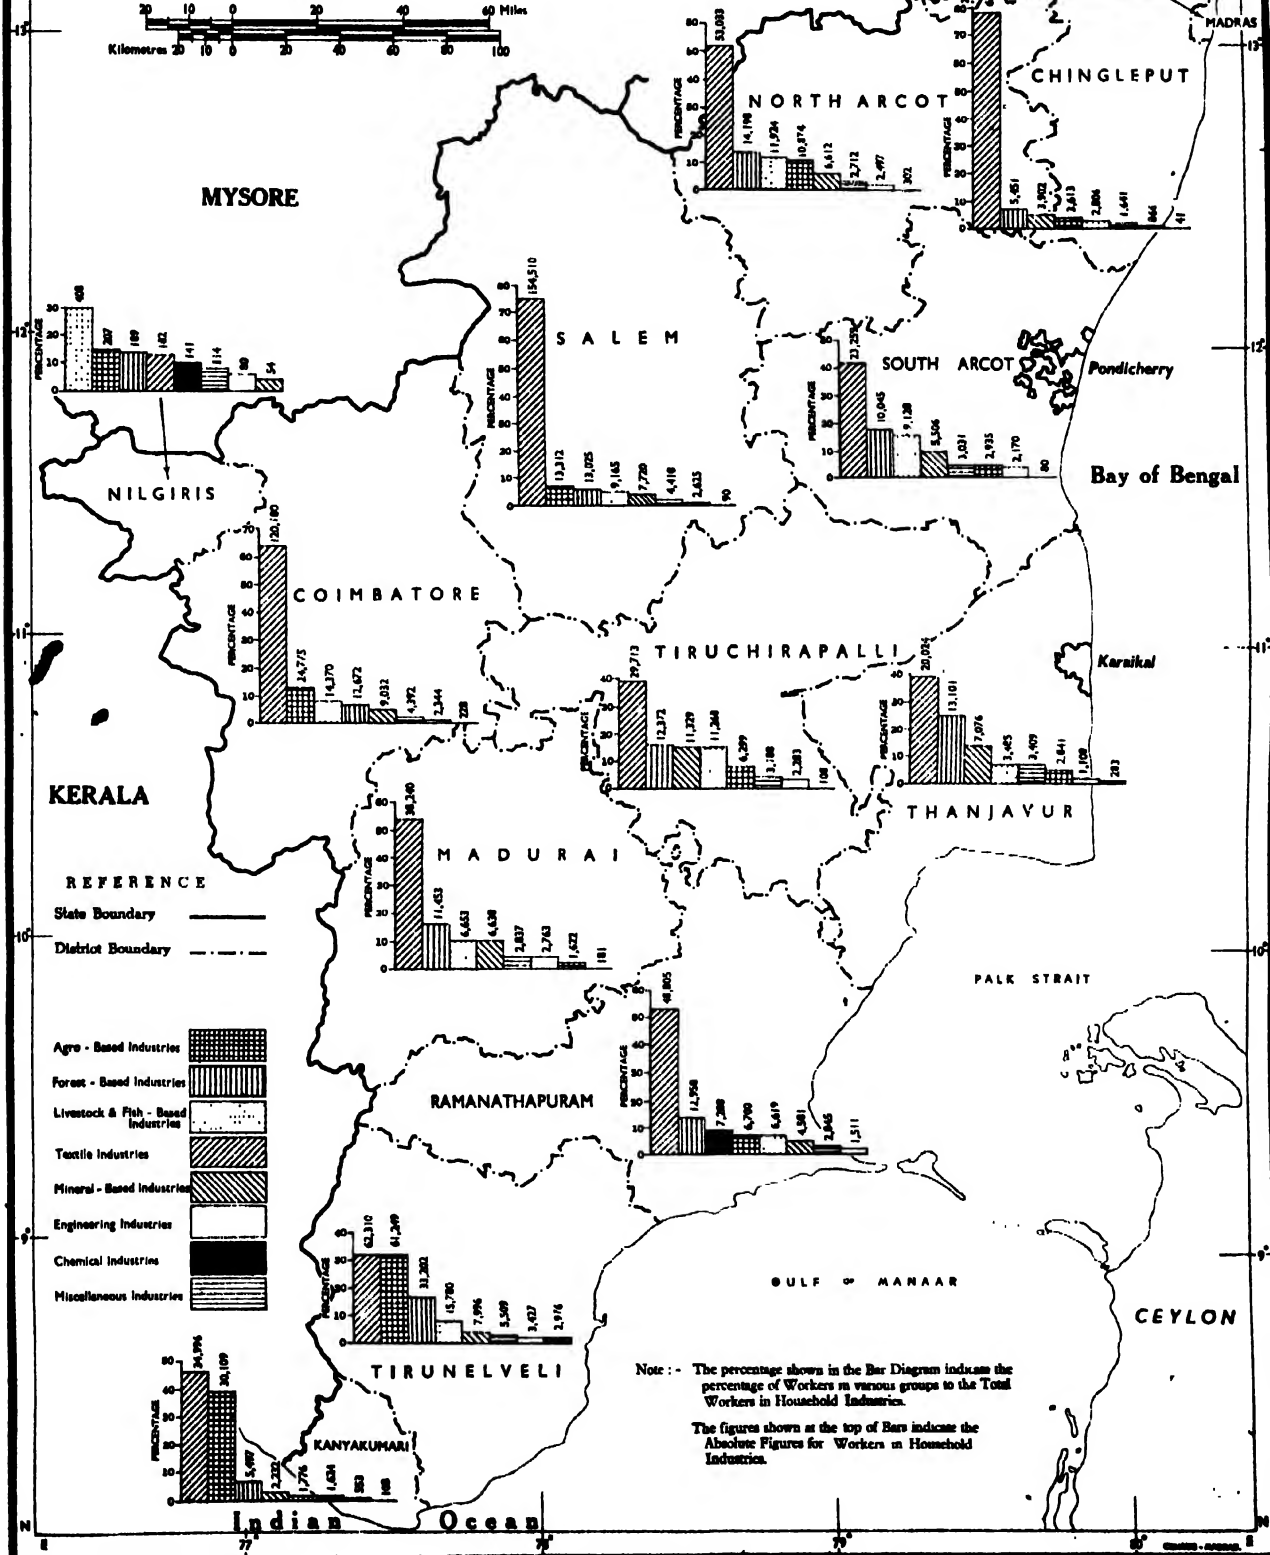

Nilgiri's figures under Division 0 reflect that primary industries are significant and indicate that manufacturing industries on household scale are not as important here as in other districts of the State.

#### Households engaged in household industry by nature of industry and size of employment

119. Union Table B-XIV Part-A gives the number of households among 20% sample households engaged in household industry by the nature of industry classified according to the I.S.I.C. division and major group and size of persons employed in those households. The following table shows the distribution of 1,000 households in each division and major group by size of employment.

# MADRAS STATE

HOUSEHOLD INDUSTRIES CLASSIFIED BY  
TYPES AND SIZE OF EMPLOYMENT, 1961

Note :- The percentage shown in the Bar Diagram indicate the percentage of Workers in various groups to the Total Workers in Household Industries.

The figures shown at the top of Bars indicate the Absolute Figures for Workers in Household Industries.

	U	(a)	43	33	5	5	...	...	...	...
		(b)	1,000	768	116	116	...	...	...	...

Out of 89,921 households engaged only in household Industry in both the rural and urban areas of the State, 39,186 or 43·6% employ 1 person each, 27,869 or 31·0% engage 2 persons, 20,219 or 22·5% of households engage 3-5 persons, 2,417 households or 2·7% engage 6-10 persons and only 228 or 0·2% engage more than 10 persons each. It will be seen that more than 70% of the households practising Household Industry employ less than 3 persons.

Compared to rural sector, the percentage of households in the sizes 3-5 persons, 6-10 persons and more than 10 persons are higher in the urban sector indicating the employment of more persons in household industries. This may also indicate the employment of a higher percentage of hired workers in household industries in the urban sector than in the rural sector. In the rural areas, the participation of outsiders other than family members in household industries is rather negligible.

#### **Division 0—Agriculture**

120. 3,995 households are engaged in this branch of industry. 3,480 are in the rural areas and 515 are in the urban sector. 556 households out of 1,000 engage 1 person, 301 employ 2 persons, 137 employ 3-5 persons and 6 engage 6-10 persons. There is no household employing more than 10 persons. This trend is also seen in the rural areas of the State. In the urban sector while the same trend is seen higher proportion of households is seen under 1 person compared to rural sector.

#### **Division 1—Mining and Quarrying**

121. In as much as only 9 out of 89,921 households are engaged in this branch of industry, it is not necessary to analyse the size of employment among the households.

#### **Divisions 2 & 3—Manufacturing**

122. 85,917 households out of 89,921 are engaged in this branch of industry. In the rural areas 55,395 out of 58,884 and 30,522 out of 31,037 in the urban sector are engaged in industries classifiable under the industrial division 2-3

Manufacturing. These figures would clearly show the preference for manufacturing and servicing industries as compared to primary industries connected with agriculture, forestry, fishing, hunting, etc. 430 out of 1,000 households employ 1 person, 310 employ 2 persons, 229 employ 3-5 persons. 28 households employ 6-10 persons and 3 households more than 10 persons. The rural sector follows the trend shown by the total sector. In the urban sector, while the decreasing trend noticed above is seen, the proportion of households engaging 3-5 persons, 6-10 persons and more than 10 persons is higher compared to rural sector, indicating that more persons are employed in conducting household industries in the urban sector than in the rural. Important major groups are 20, 22, 23, 28, 31, 34-35 and 39. Except major group 22—Tobacco and tobacco products, the others are concentrated in the rural sector.

Three aspects emerge from the above table. One is the greater number of households engaged in industries connected with manufacturing than in industries connected with agriculture, livestock, forestry, fishing, etc., both in the rural and urban sectors. Secondly, more persons (in terms of the size of employment) are being employed in the household industries connected with the manufacturing industries in both the sectors as against primary industries. Thirdly, the number of persons engaged among manufacturing industries are higher in terms of the size of employment in the urban sector than in the rural areas.

Industries connected with the manufacture of foodstuffs, tobacco and tobacco products. (beedi, cigar, chewing tobacco), textiles—cotton and silk, wood and wooden products, leather and leather products, smithy and miscellaneous items like jewellery etc. can be conducted on household scale without great effort by the family members and so become significant as household industries

#### **Employment of persons in households engaged in household industry with or without cultivation and engaged in cultivation only**

123. Union Table B-XII gives the distribution of sample households engaged in cultivation only

by size of persons engaged for rural and urban areas. Union Table B-XIV Part-A similarly shows the distribution of sample households engaged in household industry only by certain sizes of employment. In Union Table B-XV, the distribution of sample households engaged both in cultivation and household industry by size of employment is given. The size of employment has been shown as follows in all the three tables :

- |                |                         |
|----------------|-------------------------|
| 1. 1 person    | 4. 6-10 persons         |
| 2. 2 persons   | 5. More than 10 persons |
| 3. 3-5 persons | 6. Unspecified          |

The two tables presented below have been compiled from the data available in the three tables referred above. The first table shows the distribution of households by the nature of industry and size of employment. The second shows the proportionate figures of the data given in the first table, by taking the total no. of households engaged in household industry only as a base and equal to 1,000. Due to this, the figures in the other columns relating to households engaged both in cultivation and household industry as well as those engaged only in cultivation may be more than 1,000.

	U													

It is clearly seen that the predominant economic activity of the State is cultivation. This is more so in the rural areas of the State.

**Household Industry conducted singly or in combination with cultivation by period of engagement**

**and class of workers**

124. The table given below shows the distribution of 1,000 households engaged in household industry with or without cultivation in the State as a whole by period of operation and class of worker.

**TABLE XII—72**  
*Distribution of 1,000 households engaged in household industry with or without cultivation in the State classified  
 by months operated and by class of worker, 1961*

More than three-fifths of the households having household industry in addition to cultivation and more than three-fourths of the households engaged solely in household industry are engaged in their respective activities for periods varying from 10 months to one year. While the rural households show lesser proportions, urban households show much higher proportions in both the groups. About one-eighth of households engaged both in cultivation and household industry and about one-fourteenth of households engaged in household industry only are having their operations for 7-9 months. The urban households show higher proportion in the former category and lower proportion in the second category. 17.8% of households engaged both in cultivation and household industry work for 4-6 months. 7.6% of households practising household industry only are so engaged. While rural proportion is higher, urban proportion is considerably lower. Only an insignificant number of households having household industry with or without cultivation work for less than four months in a year.

#### Occupational distribution of workers at household industry

125. Table B-V gives the distribution of workers in each sex engaged in activities other than cultivation by each industrial category according to their occupational classification. The occupations have been classified into Divisions, Groups and Families as per the National classification of occupations.

The main occupational divisions which engage more than 93% of workers are Divisions 7-8, craftsmen, production process workers and labourers not elsewhere classified. The other important division is 4, farmers, hunters, loggers and related workers. The latter division engages 6.5% of workers at household industry. 94.5% of females as against 92.5% of males are engaged in occupations relating to craftsmen, production process workers and labourers not elsewhere classified. 5.4% of females as against 7.4% of males are engaged in occupations connected with farming,

plantations, forestry, animal husbandry, etc. In the case of rural areas, more females than males are recorded in Divisions 7-8 and the difference is higher than the difference in the proportions noticed in the urban sector in this occupational division. In the case of urban areas more males than females have been classified in occupational Divisions 7-8, but the difference is negligible. In the rural areas more males than females have been classified under Division 4, farmers etc. Conversely, in the urban sector more females than males are classified in this occupational division. But the difference in the proportions exhibited by sexes is not very much. The difference between the proportions recorded by the sexes is significant in the rural sector. One can also see the higher proportions of workers of both the sexes in the urban sector for occupations connected with craftsmen, production process workers and labourers not elsewhere classified. Conversely, higher proportion of workers of both the sexes is seen in the rural areas in occupations connected with farming, hunting, animal husbandry, etc.

The proportions exhibited by the sexes in the case of occupational Group 40 - farmers and farm managers, etc. and in Group 41 - farm workers, reveal a male predominance in all the three sectors which is quite reasonable in view of the peculiar nature of the occupations comprised in these groups (planters, plantation managers, farm machinery operators, gardeners, tappers, etc.). In the case of occupational Group 43 - fishermen and related workers, a female majority is seen in all the three sectors. This group comprises fishermen at deep sea, inland and coastal waters, etc. The women engaged may be conch and shell or sea-weed gatherers or fish net makers.

In Group 70 - spinners, weavers, knitters and Group 82 - millers, bakers, brew masters, etc. a female predominance is seen in the total and rural sectors. In the case of Group 70 - a male supremacy is seen in the urban sector and in the case of group 82, the proportions of both the sexes in the urban sector are equal. The proportions exhibited by the sexes, in the case of Group 84

tobacco preparers, and 85 - production process workers not elsewhere classified, show a female predominance in all the three sectors. The higher proportions of women recorded in these occupational groups suggest that these occupations can be pursued without much inconvenience to domestic duties.

In the occupational Group 72 - leather cutters, lasters, sewers and related workers, 73 - furnacemen, rollers, drawers, moulders and related metal making and treating workers, 74 - precision instrument makers, watchmakers, jewellers and related workers, 77 - carpenters, joiners, cabinet makers, coopers and related workers and 81 - potters, kilnmen, glass and clay formers and related workers, a male predominance is seen in all the three sectors which is

presumably because of the manual labour and skill involved.

#### **Participation by members of Scheduled Castes and Scheduled Tribes at Household Industry**

126. The population of Scheduled Castes and Scheduled Tribes has also been classified into workers of industrial categories and non-workers by sex as in the case of General Population. From the data available the table given below has been prepared. The table below presents at a glance the total population, total workers and workers at household industry for each sex in respect of of the General Population, Scheduled Castes and Scheduled Tribes in the State and Districts. For purposes of easy reference, percentage figures have been given.

TABLE XII — 73

(a)—General population from Table B-1

(b)—All Scheduled Castes from C VIII Part-A

(c)—All Scheduled Tribes from C VIII Part-B

(d)—Scheduled Castes as percentage of general population

(e)—Scheduled Tribes as percentage of general population

(f)—Scheduled Castes and Scheduled Tribes as percentage of general population

18.01% of the population of the State belongs to Scheduled Castes and 0.75% to Scheduled Tribes. In the rural population, Scheduled Castes constitute 20.82% and Scheduled Tribes 0.96%. In the urban population, Scheduled Castes form 10.30% and Scheduled Tribes 0.16%. The male and female proportion do not show much variation. As in the total population we find a male majority in the Scheduled population also.

18.73% of all male workers belong to Scheduled Castes and 0.82% to Scheduled Tribes. Among female workers, 25.57% belong to Scheduled Castes and 1.15% to Scheduled Tribes. The proportion of male workers follows closely their proportion to total male population. In the case of females, their percentage to total female workers is more than their percentage to total female population.

Rural proportions are higher than urban proportions and the rural areas have a concentration of scheduled population, especially in the case of tribes.

About one-tenth of male workers engaged in household industry belong to Scheduled Castes. In the case of females, only one twentieth are members of Scheduled Castes. Workers at household industry belonging to Scheduled Tribes are negligible (less than 0.25%). In the rural areas, 11.79% of male workers at household industry are Scheduled Castes and 6.80% of female workers belong to Scheduled

Castes. 0.27% of male workers at household industry are Scheduled Tribes and 0.19% of females at household industry are members of Scheduled Tribes. In the urban sector, 3.20% of male workers and 3.69% of female workers at household industry belong to Scheduled Castes. 0.05% of male workers and 0.04% of female workers at household industry are tribal people.

These figures indicate that while Scheduled Castes depend to a greater extent on household industries, Scheduled Tribes prefer agriculture to industry. In the case of urban sector, the proportion of Scheduled Caste female workers at household industry is slightly higher than the proportion shown by males. The general phenomenon of lesser proportion of workers in urban sector is found in the case of Scheduled class population also.

The information regarding the workers at household industry for the three classes of population—Non-Scheduled, Scheduled Castes and Scheduled Tribes have been given below in another form. The data for Non-Scheduled have been worked out by subtracting the figures of Scheduled Castes and Scheduled Tribes from the total population. Percentage figures for the three classes of population have been worked out for total workers as percentage of the respective population while for workers at household industry it is expressed as a percentage of total workers.

TABLE XII — 74

Non-Scheduled	8,050,360	4,101,536	3,948,824	2,173,636	527,437	201,511	166,592
				53.00	13.36	9.27	31.59
Scheduled Castes	925,840	470,444	455,396	256,541	129,464	6,679	4,614
				54.53	28.43	2.60	3.56
Scheduled Tribes	14,328	7,412	6,916	4,258	2,347	101	71
				57.45	33.94	2.37	3.03

From the above table it may be seen that 59.17% of males and 28.22% of females are workers in the Non-scheduled population. This proportion increases for males to 62.13% in respect of Scheduled Castes and to 64.15% in respect of Scheduled Tribes. In the case of females, the increase is to 44.40% in respect of Scheduled Castes and to 49.01% in respect of Scheduled Tribes. There is a definite increase in the percentage of workers under both the Scheduled Castes and Scheduled Tribes classes. The highest percentage of workers is seen among Scheduled Tribes in both the sexes indicating that their economic standard is much lower necessitating the working of all able bodied personnel among them. These tendencies are noticed in the rural and urban sectors as well. Lower percentage of workers in urban areas compared to the rural sector is noticed in all the three classes of population.

Non-scheduled population has a higher percentage of its workers under household industry in both the sexes, compared to the workers of Scheduled population. Further, a higher percentage of female workers at Household Industry is seen in the non-scheduled class while in the other two scheduled classes, the percentage of male workers is slightly higher. These

trends hold good in the rural areas. In the urban sector, the percentage of female workers is higher than males in all the three classes of population. In the case of males, the percentages shown by Non-scheduled and Scheduled Tribes are higher than females and in the case of Scheduled Castes the male percentage is slightly less than that shown by females. Except for the slightly lower percentage in respect of Scheduled Caste males, the urban proportions are higher under Household Industry for all the three classes. These figures indicate the better representation of Household Industry in urban areas in spite of the limitations of the definition adopted.

#### Common household industries

127. A table has been prepared indicating a list of common household industries from the information available in Union Table B-XIV Part-B separately for rural and urban areas. The nature of industry according to the minor group code of the Indian Standard Industrial Classification scheme as also the total number of households practising that industry in the State with figures for the districts arranged in descending order of their numbers have been given in the table.

TABLE XII- 75

*Common household industries in rural areas of Madras State, 1961*

(Figures of households given in brackets)

Minor Group of I.S.I.C.	Nature of Household Industry	Total No. of households engaged in the household industry in col. 2 for the State	District where located with the number of households engaged in the industry
1	2	3	4
<b>Field Produce and Plantation Crops</b>			
008	Production of juice (Neera) by tapping coconut trees; Production of juice by tapping other palms like date, palmyra n.e.c.	884	Tirunelveli (267), Kanyakumari (219), Coimbatore (190), Salem (87), Tiruchirapalli (64), Ramanathapuram (19), South Arcot (17), Madurai (9), Thanjavur (9), Chingleput (2), North Arcot (1)
<b>Livestock and Hunting</b>			
040	Rearing of goat for milk and animal power; Rearing of buffalo for milk and animal power; Rearing of cows for milk and animal power; Production and rearing of livestock mainly for milk and animal power n.e.c.	1,582	Tirunelveli (457), North Arcot (297), Coimbatore (237), Ramanathapuram (137), Tiruchirapalli (103), Thanjavur (87), Madurai (70), Chingleput (60), Salem (58), South Arcot (56), Kanyakumari (15), Nilgiri (5)
<b>Foodstuffs</b>			
202	Gur and Khandasari making from sugarcane and palm; Production of jaggery from coconut and palmyra juice (neera); Production of other indigenous products from sugar and jaggery n.e.c.; Production of bhoora and candy	4,901	Tirunelveli (1,408), Coimbatore (1,159), Kanyakumari (1,146), Salem (629), Ramanathapuram (325), Tiruchirapalli (125), Thanjavur (28), South Arcot (26), North Arcot (22), Madurai (19), Chingleput (14)

## Part—F

### Industrial Structure

#### Analysis of the strength of industrial categories by industrial classification

128. A detailed analysis of the strength of industrial categories classified according to the Standard Industrial Classification will throw light on the nature of economic institutions which form the 'economic base' of the State. As stated earlier, the classification has been done with a three digit classification grouping the industries into 9 Divisions, 45 Major Groups and 343 Minor Groups.

#### Relative strength of workers in divisions

129. In the following statement the industrial divisions are arranged in the descending order of proportions (in terms of percentage) for male and female non-agricultural workers.

Division	Males	Division	Females
Division 8	34.1	Division 8	46.8
.. 2 & 3	31.2	.. 2 & 3	37.1
.. 6	14.9	.. 0	6.8
.. 0	7.8	.. 6	5.9
.. 7	5.6	.. 4	1.8
.. 4	4.0	.. 1	0.7
.. 5	1.4	.. 5	0.7
.. 1	0.8	.. 7	0.3
.. 9	0.2	.. 9	N

Out of the non-agricultural workers of the State, division 8 relating to Services and divisions 2-3 relating to manufacturing account for the majority of workers both in the case of males and females. The insignificant proportion of 0.2% male workers and 0.03% female workers in this division relating to Activities not adequately described (Div. 9) proves that the recording of description of work had been quite good.

#### Relative strength in major groups

130. Subsidiary Table B-IV-9 shows the distribution of the non-agricultural workers in each industrial division, group and family. Out of the 45 major groups, the following three major groups only have recorded under each more than 10% of the total non-agricultural workers.

	Persons
Major Group 89-General Services	20.7
Major Group 23-Manufacturing of cotton textiles	12.2
Major Groups 64-68 Retail Trade	10.7

The casual labourers are included in this group of general services. Among the proportions in each specific type of industry (Minor Group) the only two minor groups out of 343 minor groups that account for more than 5% of the non-agricultural workers are the Services not elsewhere classified (general labourers) which accounts for 20.7%, and the cotton weaving in handlooms which accounts for 7.7% workers.

Minor group	Persons	Males	Females
890	20.7	15.7	34.2
235	7.7	6.7	10.3

#### Relative strength in minor groups

131. Only 13 minor groups have more than 1% of the non-agricultural male workers in each minor group. Among female non-agricultural workers only 17 minor groups have in each more than 1% of the non-agricultural female workers. The description of the specific type of industries that account for more than 1% of the total non-agricultural workers among males and females separately is furnished in the statement given below. This will show the specific type of establishment that provides greater scope of employment for the non-agricultural workers. The industries are arranged in descending order of proportions.

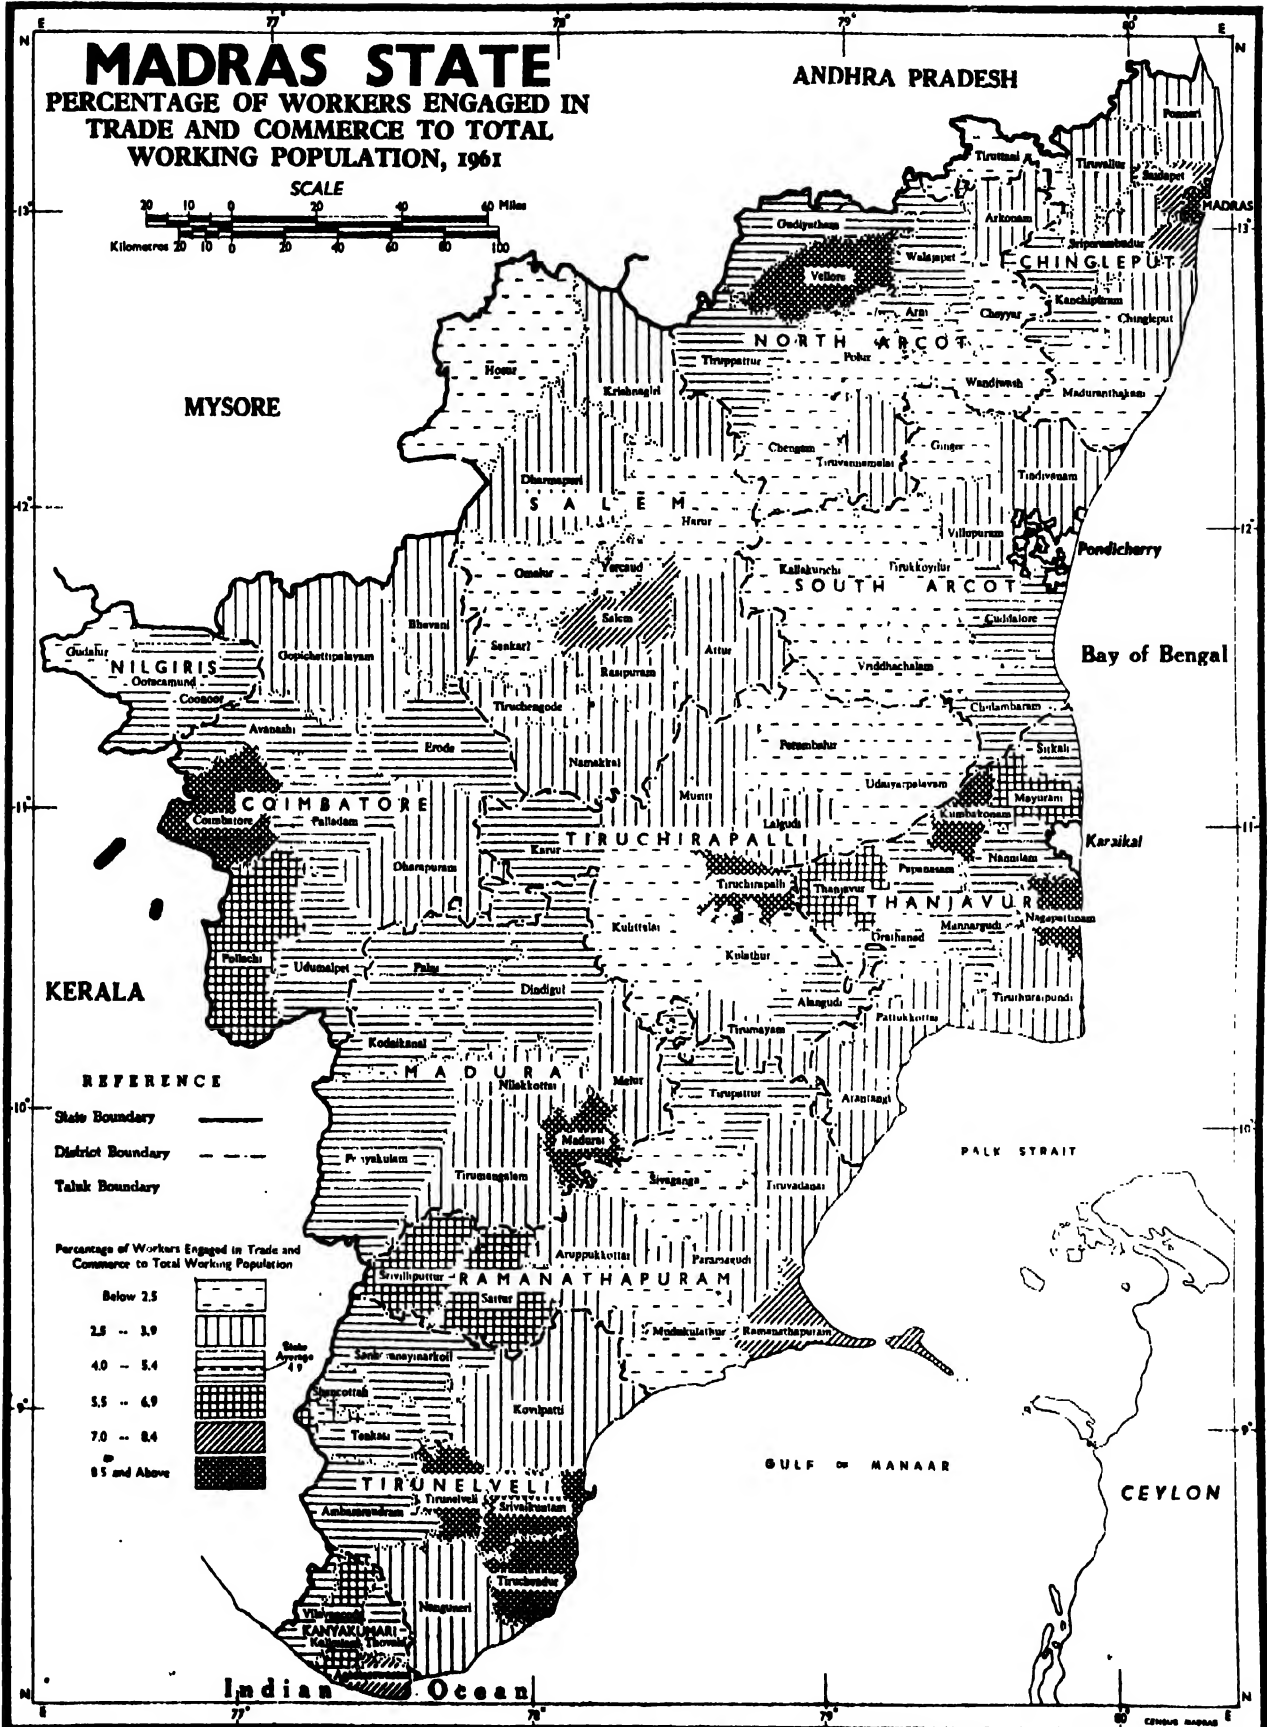

**List of industries which account in the State for more than 1% of non-agricultural workers among males and females**

Type of Industry	Percentage of Males among non-agricultural workers	Type of Industry	Percentage of Males among non-agricultural workers
1 Services rendered by hotels, boarding houses, eating houses, cafes, restaurants and similar other organisations to provide lodging and boarding facilities. (Minor group (882)	2.89	10 Manufacture of jewellery, silverware and wares using gold and other precious metals (393).	1.38
2 Retail trading in goods unspecified. (689)	2.66	11 Transporting by railways (700).	1.33
3 Educational services such as those rendered by colleges, schools and similar other institutions of non-technical type. (811)	2.54	12 Manufacture of Bidi (220).	1.11
4 Cotton spinning and weaving in mills. (232)	2.34	13 Manufacture of other wood and allied products not covered above (289).	1.09
5 Laundry services rendered by organisations and individuals (includes all types of cleaning, dyeing, bleaching, drycleaning services) (883).	2.30		
6 Public services in administrative departments and offices of State Governments (809).	2.26	Type of Industry	Percentage of Females among non-agricultural workers
7 Making of textile garments including raincoats and head-gear (273).	1.55	1 Cotton weaving in handlooms (235).	10.28
8 Hair dressing, other services rendered by organisations and individuals such as those by barber, hairdressing saloon and beauty shops (884).	1.44	2 Cotton spinning (other than in Mills) (231).	6.02
9 Retail trading in fibres, yarns, dhoti, saree, readymade garments of cotton, wool, silk and other textiles and hosiery products; (this includes retail trading in piecegoods of cotton, wool, silk and other textiles)	1.44	3 Manufacture of materials from cork, bamboo, cane, leaves and other allied products (288).	4.26
		4 Laundry services rendered by organisations and individuals (includes all types of cleaning, dyeing, bleaching, dry cleaning services) (883).	4.04
		5 Educational services such as those rendered by colleges, schools and similar other institutions of non-technical type (811).	3.17
		6 Production of indigenous sugar, gur from sugarcane or palm juice and production of candy (202)	3.12

17 Public health and medical services rendered by organisations and individuals such as by hospitals, sanatoria, nursing homes, maternity and child welfare clinic as also by hakim, unani, ayurvedic, allopathic and homoeopathic practitioners (820).	1.00

Among the manufacturing establishments, the industry of Cotton weaving in handlooms engages the maximum amount of male and female workers. Madras State is an important handloom weaving centre in the country and the products produced in this State are exported to many countries. This is probably the only traditional industry of India that still survives in spite of the competition of big mechanical establishments. Except in 4 out of 13 districts, (Madras, Nilgiri, Thanjavur and Kanyakumari districts) in all other districts the industry of cotton weaving in handlooms accounts for the highest number of male workers. Among female workers excepting in 6 out of 13 districts (Madras, Nilgiri, Thanjavur, Kanyakumari, Tiruchirapalli and Tirunelveli) in other districts this industry accounts for the highest number. In Madras district the industry of cotton weaving and spinning in mills accounts for 9.3% of the manufacturing sector workers which is the largest proportion. In Nilgiri district the industry relating to manufacture of ammunition, explosives and fire-works accounts for the largest proportion of manufacturing workers (16.8%) since the Aravankadu factory which makes these materials is situated in this district. In Kanyakumari, the industry producing indigenous sugar, gur from sugarcane or palm juice and production of candy accounts for the largest number of male workers (24.1%) and also female workers (28.0%) among the workers in divisions 2-3. In the districts of Madras and Tirunelveli, the industry relating to manufacture of bidi accounts for the largest number of female workers forming 30.9% and 24.7% respectively of the female workers in manufacturing establishments. Nilgiri being an important plantation area, the industry relating to processing of tea in factories accounts for 35.6% of manufacturing workers among females.

The following Statement presents particulars of first three industries which account for the highest proportion of workers separately for males and females among the total male and female workers coming under Division 2-3 relating to manufacturing.

**MADRAS DISTRICT**

Type of Industry	No. of males
Cotton spinning and weaving in mills (232).	275
Manufacture of wagons, coaches, tramways and other rail-road equipment other than that covered by code No. 363 (381)	201
Making of textile garments including rain-coats and head-gear (273)	194
	No. of females
Manufacture of bidi (220)	442
Cotton weaving in handlooms (235)	203
Manufacture of materials from cork, bamboo, cane, leaves and other allied products (288)	80

**CHINGLEPUT DISTRICT**

Type of Industry	No. of males
Cotton weaving in handlooms (235)	1,083
Weaving of silk textile by handlooms (264)	242
Manufacture of structural clay products such as bricks, tiles (340)	164
	No. of females
Cotton weaving in handlooms (235)	1,872
Weaving of silk textile by handlooms (264)	421
Cotton spinning (other than in mills) (231)	382

**NORTH ARCOT DISTRICT**

Type of Industry	No. of males
Cotton weaving in handlooms (235)	796
Manufacture of bidi (220)	713
Currying, tanning and finishing of hides and skins and preparation of finished leather (310)	222

Type of Industry	No. of females
Cotton weaving in handlooms (235)	1,048
Cotton spinning (other than in mills) (231)	537
Manufacture of materials from cork, bamboo, cane leaves and other allied products (288)	443

**SOUTH ARCOT DISTRICT**

Type of Industry	No. of males
Cotton weaving in handlooms (235)	796
Manufacture of other wood and allied products not covered above (289)	177
Making of textile garments including rain-coats and headgear (273)	139
	No. of females
Cotton weaving in handlooms (235)	1,048
Cotton spinning (other than in mills) (231)	537
Manufacture of materials from cork, bamboo, cane, leaves and other allied products (288)	443

**SALEM DISTRICT**

Type of Industry	No. of males
Cotton weaving in handlooms (235)	1,814
Weaving of silk textile by handlooms (264)	263
Manufacture of jewellery, silverware and wares using gold and other precious metals (393)	200
	No. of females
Cotton weaving in handlooms (235)	2,016
Cotton spinning (other than in mills) (231)	699
Production of indigenous sugar, gur from sugarcane or palm juice and production of candy (202)	235

**COIMBATORE DISTRICT**

Type of Industry	No. of males
Cotton weaving in handlooms (235)	768
Cotton spinning and weaving in mills (232)	686
Production of indigenous sugar, gur from sugarcane or palm juice and production of candy (202)	167

**No. of females**

Cotton weaving in handlooms (235)	947
Cotton spinning (other than in mills) (231)	893
Cotton spinning and weaving in mills (232)	335

**NILGIRI DISTRICT**

Type of Industry	No. of males
Manufacture of ammunition, explosives and fire-works (333)	179
Processing of tea in factories (217)	127
Production of bread, biscuits, cake and other bakery products (205)	70

**No. of females**

Processing of tea in factories (217)	80
Manufacture of structural stone goods, stone dressing and stone crushing (343)	29
Manufacture of sundry hardwares such as G. I. pipe, wire net, bolt, screw, bucket, cutlery (This will also include the manufacture of sundry ferrous engineering products done by jobbing engineering concerns which cannot be classified in major groups 36, 37, 38 and 39) (369)	20

**MADURAI DISTRICT**

Type of Industry	No. of males
Cotton weaving in handlooms (235)	519
Cotton spinning and weaving in mills (232)	423
Making of textile garments including rain-coats and head-gear (273)	185

**No. of females**

Cotton weaving in handlooms (235)	504
Cotton spinning (other than in mills) (231)	388
Manufacture of materials from cork, bamboo, cane, leaves and other allied products (288)	268

**TIRUCHIRAPALLI DISTRICT**

Type of Industry	No. of males
Cotton weaving in handlooms (235)	440
Manufacture, assembly and repairing of locomotives (380)	231
Manufacture of jewellery, silverware and wares using gold and other precious metals (393)	181

**No. of females**

Cotton spinning (other than in mills) (231)	791
Cotton weaving in handlooms (235)	586
Manufacture of materials from cork, bamboo, cane, leaves and other allied products (288)	362

**THANJAVUR DISTRICT**

Type of Industry	No. of males
Manufacture of other wood and allied products not covered above (289)	188
Weaving of silk textile by handlooms (264)	177
Manufacture of jewellery, silverware and wares using gold and other precious metals (393)	176

**THANJAVUR DISTRICT (Contd.)**

Type of Industry	No. of females
Manufacture of materials from cork, bamboo, cane, leaves and other allied products (288)	750

Cotton spinning (other than in mills) (231)	333
Manufacture of earthenware and earthen pottery (350)	324

**RAMANATHAPURAM DISTRICT**

Type of Industry	No. of males
Cotton weaving in handlooms (235)	779
Making of textile garments including rain-coats and head-gear (273)	165
Manufacture of jewellery, silver-ware and wares using gold and other precious metals (393)	155

	No. of females
Cotton weaving in handlooms (235)	1,720
Manufacture of matches (334)	1,036
Manufacture of materials from cork, bamboo, cane leaves and other allied products (288)	645

**TIRUNELVELI DISTRICT**

Type of Industry	No. of males
Cotton weaving in handlooms (235)	673
Cotton spinning and weaving in mills (232)	346

Type of Industry	No. of males
Production of indigenous sugar, gur from sugarcane or palm juice and production of candy (202)	262

	No. of females
Manufacture of bidi (220)	1,527
Manufacture of materials from cork, bamboo, cane, leaves and other allied products (288)	1,206
Cotton weaving in handlooms (235)	1,032

**KANYAKUMARI DISTRICT**

Type of Industry	No. of males
Production of indigenous sugar, gur from sugar cane or palm juice and production of candy (202)	545
Cotton weaving in handlooms (235)	306
Manufacture of jewellery, silver-ware and wares using gold and other precious metals (393)	128

	No. of females
Production of indigenous sugar, gur from sugarcane or palm juice and production of candy (202)	1,951
Cotton spinning (other than in mills) (231)	1,482
Manufacturing of cotton nets (238)	1,246

(a) Absolute figure : (b) Proportion per 10,000.

### Industrial composition in rural areas

132. Though the rural area has an agrarian structure, not all are agricultural workers. Many industries allied to agriculture are found in rural areas. The following statement relating to the non-agricultural sector presents the industrial composition in rural and urban areas.

Division		Rural areas		Urban areas	
		Males	Females	Males	Females
1		2	3	4	5
All Divisions	...	100·00	100·00	100·00	100·00
0	...	11·70	6·73	3·88	6·79
1	...	1·15	0·83	0·36	0·36
2 & 3	...	29·45	34·45	33·01	42·46
4	...	3·88	1·45	4·07	2·51
5	...	1·04	0·31	1·80	1·41
6	...	10·03	5·25	19·89	7·40
7	...	2·30	0·06	8·98	0·82
8	...	40·40	50·90	27·74	38·19
9	...	0·05	0·02	0·27	0·06

Among the non-agricultural male workers in both areas the manufacturing and other services are the two sectors that account for the largest proportion. But while among male workers in urban area manufacturing accounts for the first highest proportion (33%) and other services the next highest (27%), in the rural areas the other services account for the first highest (40%) and manufacturing the next highest. The same position is observed among female workers also. In the rural areas the other two industrial divisions each of which account for about 10% among male workers and about 5 to 7% among female workers are livestock, forestry and fishing and hunting (Division 0) and trade and commerce.

### Women workers in the industrial composition

133. In each of the industrial divisions of Transport, Storage and Communication (Div. 7), Electricity, Gas, Water and Sanitary services (Div. 5), Construction (Div. 4), Mining and Quarrying (Div. 1), the women workers form less

than 1%. Though women in their claim to equality have begun taking up work in almost all types of industrial establishments, the hazards, discomforts and hard manual labour involved in certain industries combined with the stronger bond of tradition and custom remain as a barrier and thus mainly contribute to the differentials in the proportion of men and women employed in these types of industries. The following statement presents the list of specific industries (minor group) in the State in which the number of females employed is less than 100 while the number of men employed is more than 10,000 *i.e.* ten times more than the number of women employed.

Name of Industry	No. employed	
	Males	Females
Repairing of bicycles and tricycles (388)	17,936	41
Repairing and servicing of motor vehicles (384)	17,126	47
Retail trading in precious stones and jewellery (686)	10,089	57
Manufacture of wagons, coaches, tramways and other rail road equipment other than that covered by Code No. 363 (381)	14,260	58
Manufacture and assembling of motor vehicles of all types (excepting motor engines) (382)	10,451	62
Manufacture, assembly and repairing of locomotives (380)	18,007	76

It can be seen that these are industries in which most of the jobs involve hard and manual labour and hence such a low number of women employees is found.

But cases of certain types of industrial establishments which have female workers in far greater number than male workers also exist. The following are the two industries in which

the number of females employed is more than ten times the number of men employed.

Name of Industry	No. employed	
	Males	Females
Manufacturing of cotton nets (238)	535	12,895
Cotton spinning (other than in mills) (231)	8,707	98,520

In the industry of manufacture of matches the number of females employed is three times greater than the number of men employed (Males 6,528 ; Females 19,957) and in the manufacture of materials from cork, bamboo, etc., the number of females employed is more than two times the number of men employed.

## Part - G

### Occupational Structure

#### Analysis of strength of workers in Occupational Divisions

134. There is no other 'single set of closely related facts that tells so much about a nation as do detailed statistics of the occupations of its workers'. The occupational characteristics will be in the first instance analysed with the help of the National Occupational Classification which has classified the occupations as Divisions, Groups and Families by the three digit system. The following statement presents the proportion under the various occupational divisions :

Occupational Division	Total employed		Percentage distribution	
	M	F	M	F
Professional, Technical and related workers (0)	229,451	68,921	5.2	4.2
Administrative, Executive and Managerial workers (1)	188,783	8,748	4.3	0.5
Clerical and related workers (2)	301,760	7,257	6.8	0.4
Sales workers (3)	535,447	82,042	12.1	5.0
Farmers, Fishermen, Hunters, Loggers and related workers (4)	350,126	122,097	7.9	7.5
Miners, Quarrymen and related workers (5)	27,746	10,239	0.6	0.6
Workers in Transport and Communication occupations (6)	156,781	1,145	3.5	0.1
Craftsmen, Production workers and Labourers not elsewhere classified (7-8)	2,248,068	1,203,294	50.8	73.5

Occupational Division	Total employed		Percentage distribution	
	M	F	M	F
Service, Sport and Recreation workers (9)	385,356	132,807	8.7	8.1
Workers not classifiable by occupation (X)	4,739	607	0.1	0.1

The most striking fact is that among male workers half of them and among female workers three-fourth are 'Craftsmen, Production process workers' (Divs. 7-8). The detailed analysis of the occupations coming under this division will show that this is due to most of the traditional occupations of this State like spinners, weavers, harness and saddle makers, jewellers, goldsmiths, potters, etc., having been classified under this division. Slightly more than one-tenth of the male workers forming the next higher proportion are distributive workers (Sales workers while the supervisory officials like administrative, executive and managerial workers form only 4% among male workers. The clerical staff and the service workers form about 15% of male workers. The following statement presents the occupational distribution of male and female workers separately in the State with the occupational Divisions arranged in the descending order of proportions.

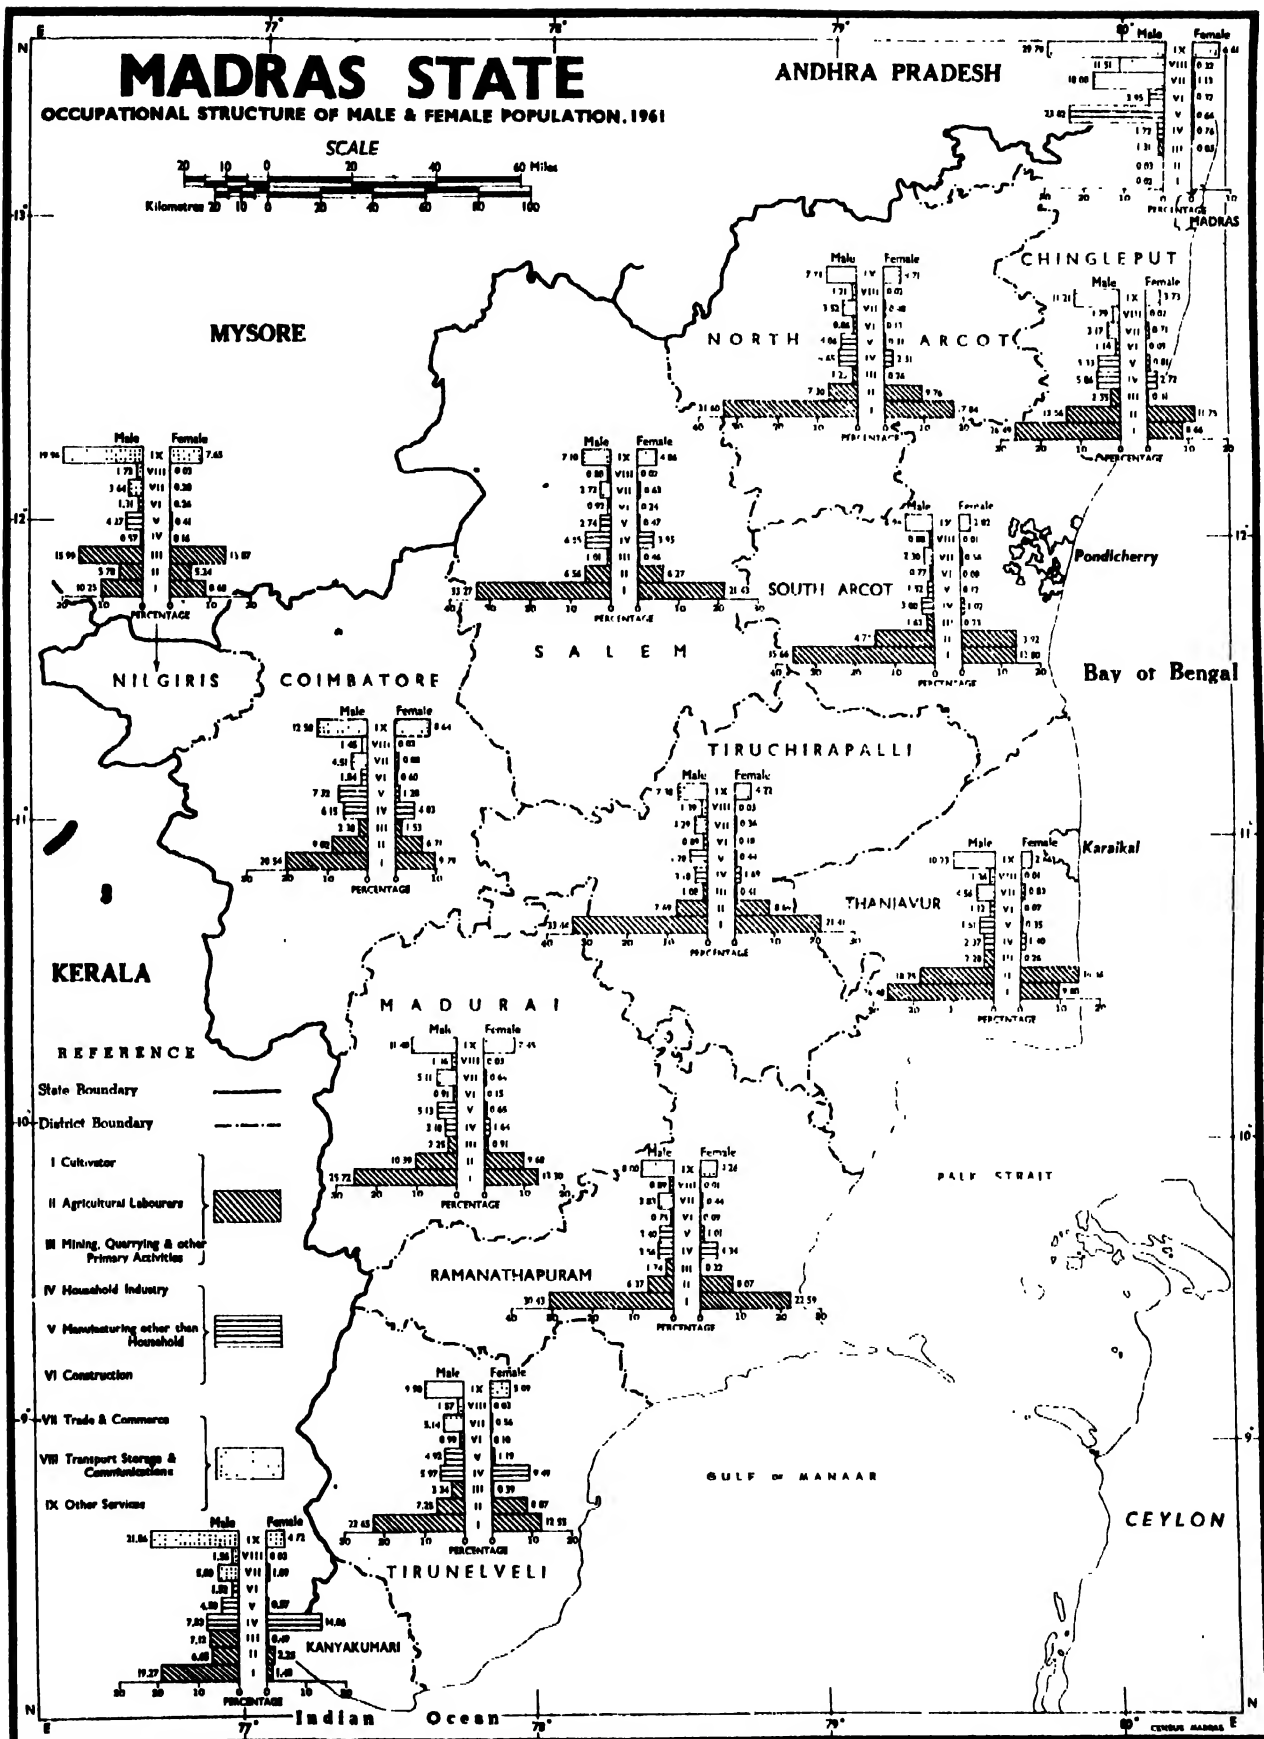

Males	Females
Craftsmen, Production Process workers and Labourers not elsewhere classified (7-8) (50.8)	Craftsmen, Production Process workers and Labourers not elsewhere classified (7-8) (73.5)
Sales workers (3) (12.1)	Service, Sport and Recreation workers (9) (8.1)

# MADRAS STATE

OCCUPATIONAL STRUCTURE OF MALE & FEMALE POPULATION, 1961

ANDHRA PRADESH

SCALE

Males	Females
Service, Sport and Re-creation workers (9) (8.7)	Farmers, Fishermen, Hunters, Loggers and related workers (4) (7.5)
Farmers, Fishermen, Hunters, Loggers and related workers (4) (7.9)	Sales workers (3) (5.0)
Clerical and related workers (2) (6.8)	Professional, Technical and related workers (0) (4.2)
Professional, Technical and related workers (0) (5.2)	Miners, Quarrymen and related workers (5) (0.6)
Administrative, Executive and Managerial workers (1) (4.3)	Administrative, Executive and Managerial workers (1) (0.5)
Workers in Transport and Communication Occupations (6) (3.5)	Clerical and related workers (2) (0.4)
Miners, Quarrymen and related workers (5) (0.6)	Workers in Transport and Communication Occupations (6) (0.1)
Workers not classifiable by Occupation (X) (0.1)	Workers not Classifiable by Occupation (X) (0.1)

It can be seen that Professional, Technical and related workers form only 5% of male workers and 4% of female workers. Among female workers the supervisory officials do not even form 1% and the clerical workers also form an insignificant proportion of 0.4%. But the service workers form 8% which is almost equivalent to that of the corresponding proportion among males.

#### Occupational distribution in districts

135. The following statement presents the occupational distribution in each district in descending order of proportions for males and females separately for each district.

#### MADRAS DISTRICT

Division	Males	Division	Females
7—8	41.48	9	30.43
2	18.32	7—8	28.16

Division	Males	Division	Females
7—8	55.99	7—8	70.43
4	15.43	4	14.70
3	9.36	3	4.94
9	5.05	9	4.86
0	5.00	0	4.51
2	3.24	2	0.22
6	2.48	1	0.21
1	2.16	5	0.11
5	1.28	6	0.01
X	0.01	X	0.01

It can be seen from the statement that among male workers excepting in Nilgiri district in every other district of the State, the occupational Division of Craftsmen, Production process workers (7-8) ranks first. The proportion of clerical workers ranks second only in the case of Madras district while in 9 out of the 13 districts the proportion of Sales Workers ranks second. Madras being the headquarters of the State and the seat of administration, it is not surprising that the Clerical workers who form the bulwark of any administrative system rank the second highest proportion.

**Categorywise analysis of occupational distribution**

136. The following table presents the proportion of workers of each sex in the occupational Divisions, Major Groups and Minor Groups for the State.

TABLE

*Proportion of workers of each sex to total of all workers (per 10,000 of all workers)***Madras**

Analysing the categorywise proportions in each division, it can be seen that the category of other services accounts for the highest proportions in the divisions relating to Professional workers (Div. 0), Administrative and executive officials (Div. 1), Clerical and related workers (Div. 2), Craftsmen and Production Process workers (Divs. 7-8) and Service workers (Div. 9). This is due to the Government being the largest employer providing employment in the various types of occupations which are classified under these divisions.

#### Inter-relationship of industrial and occupational classification

137. The inter-relationship between the industrial and occupational classification can be seen from the statement in which the industrial category which accounts for the largest proportion in each occupational division has been given.

Occupational Division		Industrial Category accounting for highest proportion
Division	0	IX
"	1	IX
"	2	IX
"	3	VII
"	4	III
"	5	III
"	6	VIII
Divisions	7-8	IX
Division	9	IX

#### Relative strength of occupational groups

138. The various occupational groups which in each division account for the first three largest proportions will be analysed now. These groups have been marked with an asterisk mark in the table given above. Among the professional, technical and related male workers (Division 0 workers), teachers (45.1) and artists, writers and related workers (9%) form the largest number. In the case of female workers also teachers form the highest number (72.2%) and the group

of nurses and other medical and health technicians form (18%) being the next highest and physicians (3.1%) the third highest. Clerical workers (M-61.1%; F-61%) form more than half of the workers under Division 2 both among male workers and female workers. Among the transport and communication workers in the case of males the group of drivers of road transport accounts for the largest number forming more than 60% of the male workers of this Division, while in respect of females the occupational group of telephone and other tele-communication operators form about 70% of the female workers of this division. It will be significant to note that both among male and female workers the 'general labourers' group forms 35% and 48% respectively. Such a high proportion out of the total male and female workers of craftsmen, production process workers (Divs. 7-8) indicates that for many, their jobs are not permanent and literally they live each day, not sure whether they would find employment the next day. The next occupational group which accounts for the second highest percentage of workers both among male and female workers in this division is that of spinners, weavers, knitters and related workers. (M-20.6%; F-26.5%) In the occupational Division relating to service workers, 26% of total male workers in this division and half of the female workers are launderers.

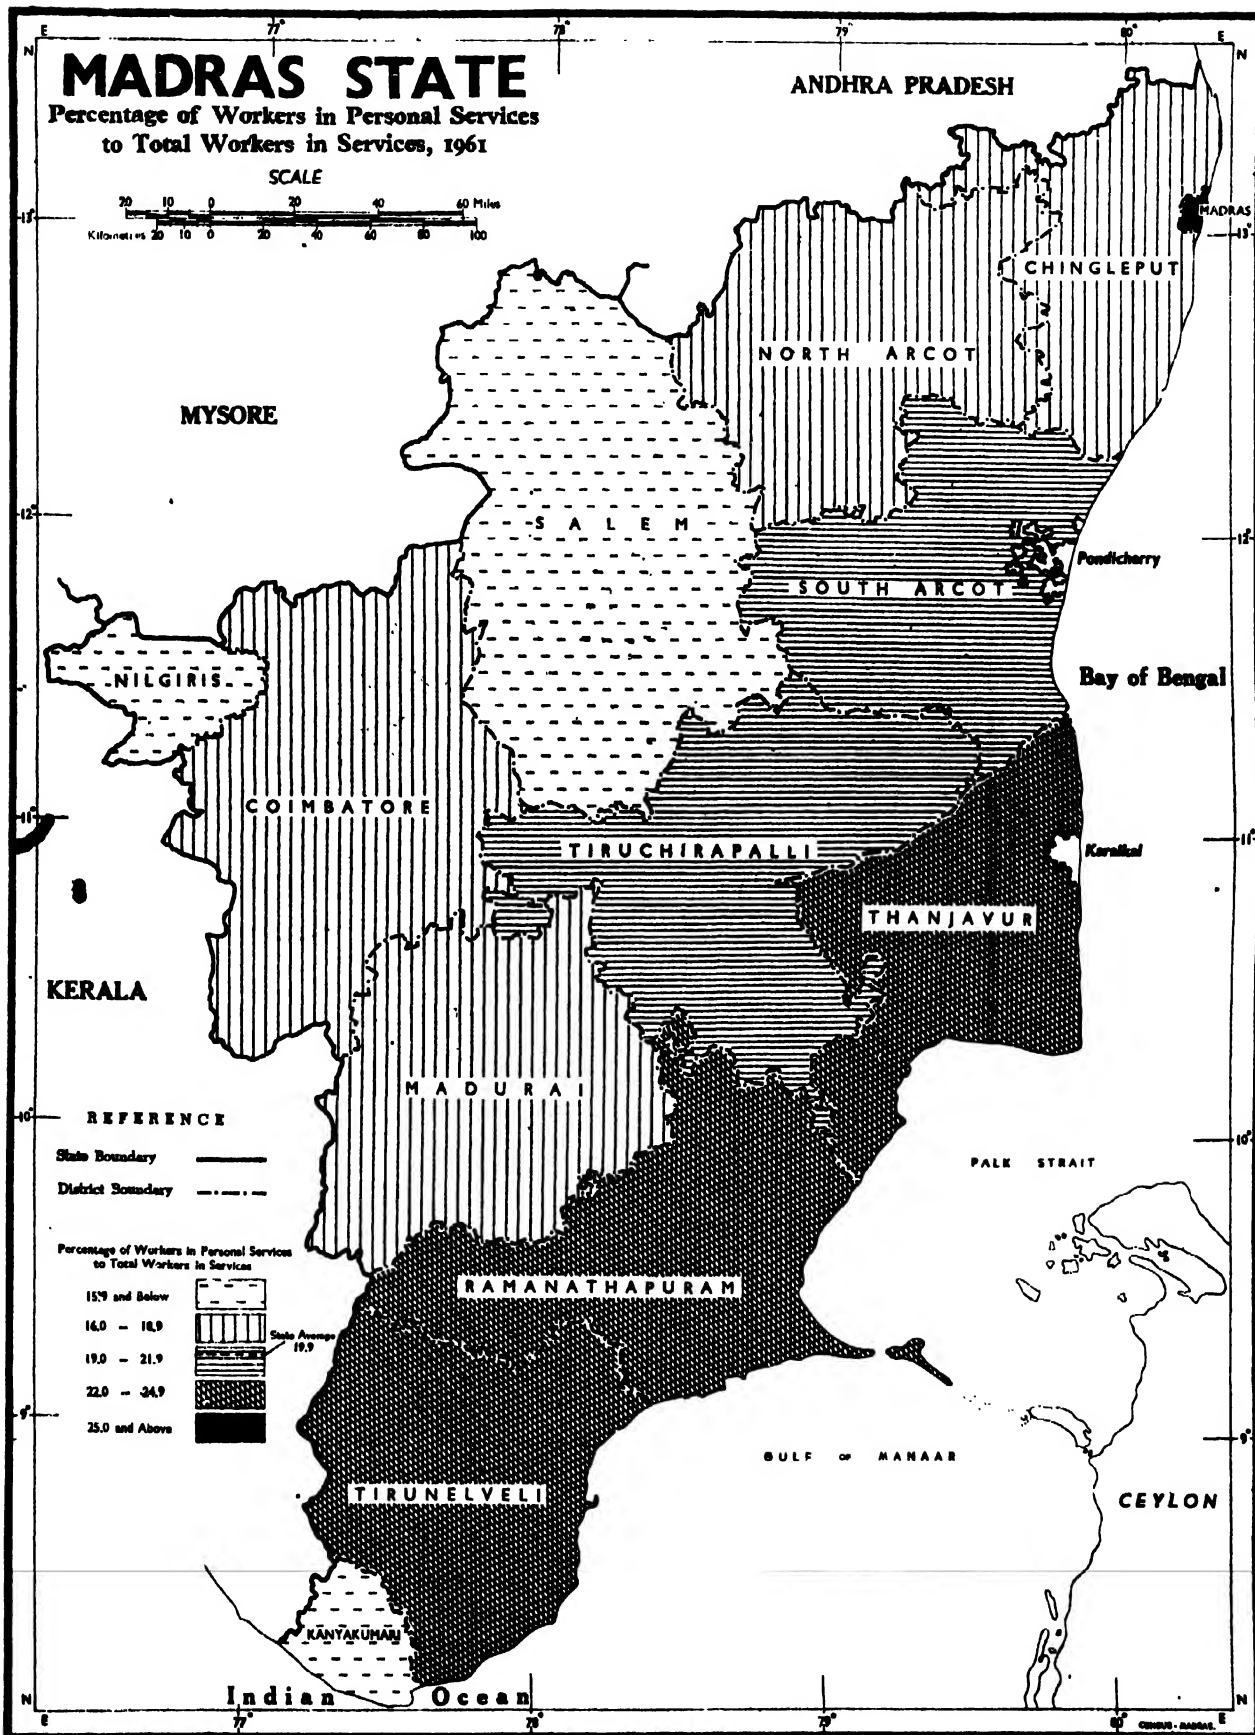

In the statement given below, the occupational groups and families each of which accounts for more than 0.5% of total non-agricultural workers have been listed out.

Thus among male workers only 35 out of the 75 occupational groups and 46 out of 331 families classified under National Classification of Occupations account for 5% of male workers in each of the respective divisions and groups. As regards the female workers, such occupational groups number 20 forming 26% of total occupational groups and families number 26 forming 8% of total occupational families.

### Analysis of the strength of certain important occupations

139. Though each kind of occupation is useful in its own way in the economy of the nation, the services rendered by certain occupations are noble and vital. The strength in each of such occupations will be analysed now.

### Physicians, Surgeons and Dentists

140. Taking first the physicians, surgeons and dentists we see that there are 16,463 males and 2,116 females and out of this, the allopathic physicians and surgeons constitute less than 25% among males and about 40% among females. Taking the group of physicians and surgeons and dentists as a whole, the number of households to be covered by each in this group, if there is an equitable distribution of the service rendered by them, amounts to 391. Taking the rural and urban areas separately, it is seen that there is wide disparity between the numbers to be covered. While each in this occupational group has only 177 households to be covered in the urban areas, in the rural areas 679 households have to be covered by each. This clearly indicates the urgent need for more doctors to serve in rural areas.

The following statement presents the number of households to be covered by each physician for total, rural and urban areas separately.

### Number of Households per Doctor

State/District	Total	Rural	Urban
<b>Madras State</b> ...	<b>391</b>	<b>679</b>	<b>177</b>
Madras ...	150	...	150
Chingleput ...	466	642	232
North Arcot ...	416	814	136
South Arcot ...	578	850	178
Salem ...	561	984	168
Coimbatore ...	434	782	204
Nilgiri ...	441	794	279
Madurai ...	398	802	187
Tiruchirapalli ...	457	882	159
Thanjavur ...	317	426	154
Ramanathapuram ...	479	811	212
Tirunelveli ...	409	563	253
Kanyakumari ...	206	238	117

Apart from Madras District which is entirely an urban area, in the urban areas of North Arcot, Tiruchirapalli, Thanjavur and Kanyakumari the number of households to be covered by each in this occupational group is less than the State average and surprisingly it is the lowest in Kanyakumari district. Even in the rural areas of this district only 238 households have to be covered by each and this is the lowest number to be covered compared to all other rural areas. The largest number of 984 households have to be covered in rural areas of Salem district and among the urban areas the largest number of 279 households have to be covered in Nilgiri district. It can be seen that even by assuming availability of equitable distribution of services, the number of households to be covered by each physician is so large, particularly in rural areas, that the present number is grossly inadequate.

#### Nurses

141. The number of people who have to be taken care of by each nurse, if there has to be an equitable distribution, and if the services have to be provided for all, is as high as 5,525. In the rural areas it is extraordinarily high being 24,623 while in urban areas it is only 1,765. The following statement presents the number of population to be served by a nurse.

#### Population served by a Nurse

Salem	19,021	43,654	4,861
Coimbatore	6,263	23,824	2,214
Nilgiri	2,132	3,824	1,363
Madurai	5,010	26,137	1,824
Tiruchirapalli	10,528	59,810	2,598
Thanjavur	9,067	27,204	2,515
Ramanathapuram	12,814	27,199	4,914
Tirunelveli	9,546	15,181	5,234
Kanyakumari	5,060	9,205	1,430

Only in Madras City, the number is very much less, being 837. In the urban areas of North Arcot, Nilgiri and Kanyakumari the number is less than the State urban average. The rural areas of the districts of Nilgiri, Kanyakumari, Chingleput, Tirunelveli and Coimbatore are comparatively much better off than the rural areas of other districts. It should however be remembered that though, statistically presented, the situation seems to be hopelessly bad, in reality, it would not be so, as luckily all the persons would not be falling sick at the same time.

#### Midwives and Health Visitors

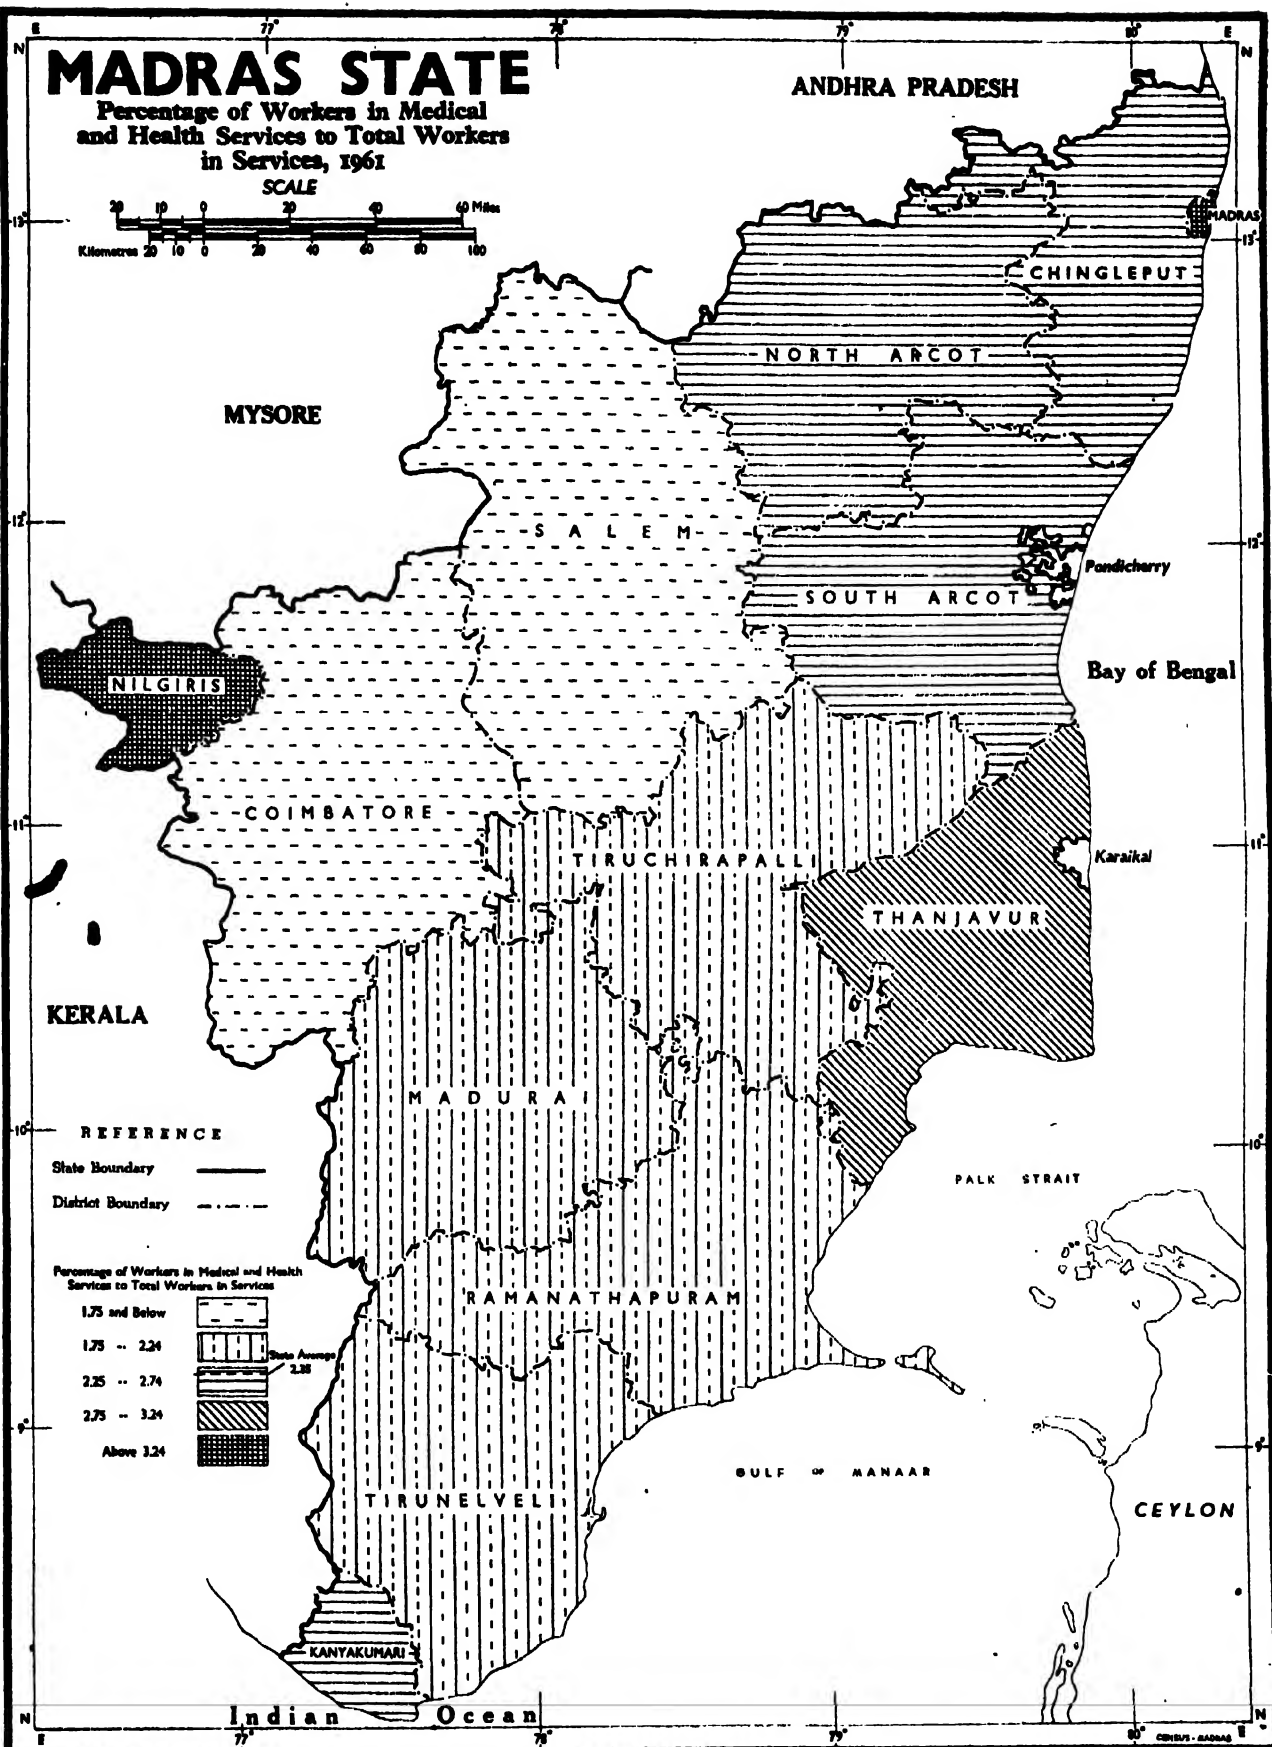

142. The number of Midwives and Health Visitors to married women would give an idea of the easy availability of maternity assistance. There are only 4,390 midwives and health visitors in the State and the married women of reproductive age group namely 15—44 number 60,03,872. It means that each midwife has to take care of 1,368 married women. Madras has the best service in that the number of married women to be taken care of by one midwife is only 490 and Salem is at the other extreme, the number of married women to be taken care of by a midwife amounting to 3,345. The districts of Chingleput, North Arcot, Nilgiri, Thanjavur and Ramanathapuram are comparatively better than the other districts. In these districts the number forms less than the State average. The ratio of the number of married women of 15—44 to midwives is given below.

#### No. of Married women of 15—44 per midwife

<b>Madras State</b>	<b>...</b>	<b>1,367</b>
Madras	...	490

**Teachers**

143. Taking the teachers as a whole and considering their number in relation to full-time students as recorded in Census, it is seen that each teacher has to teach about 25 persons. The number ranges from 28 in Madras to 19 in Nilgiri and in no district it exceeds 28.

**Postmen**

144. The number of households to be covered by a postman, assuming again an equitable distribution, works out to 681 households. In the rural areas one has to cover as many as 1,001 households while in urban areas it is only 356. It can be assumed that lesser the number to be covered, the quicker and better would be the service. Judging the position from that view it is in the urban areas of Thanjavur district and in Madras district that the service is the best. But even here one has to cover about 250 households. It is surprising to note that the highest number to be covered among the urban areas is in Madurai district. In the rural areas it is in Kanyakumari district. Here highest number of 1,536 households have to be covered. The following statement presents the number of households to be covered by each postman in the total, rural and urban areas for each district.

**Number of Households per Postman**

State/District	Total	Rural	Urban
<b>Madras State</b> ...	<b>681</b>	<b>1,001</b>	<b>356</b>
<b>Madras</b> ...	251	...	251
<b>Chingleput</b> ...	599	798	308
<b>North Arcot</b> ...	709	853	414
<b>South Arcot</b> ...	749	992	276
<b>Salem</b> ...	1,172	1,503	532
<b>Coimbatore</b> ...	838	1,097	523
<b>Nilgiri</b> ...	422	911	248

State, District	Total	Rural	Urban
Madurai ...	903	1 297	537
Tiruchirapalli ...	809	1 062	421
Thanjavur ...	525	713	250
Ramanathapuram ...	776	1,075	419
Tirunelveli ...	631	855	397
Kanyakumari ...	1,060	1,536	383

**Occupational Composition of Women Workers**

145. It is interesting to note that about one-fifth of the allopathic physicians and surgeons in the State are women. While among teachers taken as a whole, about 30% are women, among the University teachers women form less than 15%. But among the Middle and Primary School teachers they form more than one-third of the total. Though normally women may appear better suited than men to be musicians, out of the 12,175 persons recorded as musicians and related workers only 416 forming less than 5% are women. Though women are considered more suitable than men for being stenographers and typists, only slightly more than 10% of the stenographers and typists are women. But even among the working proprietors of retail trade, women workers form more than 10% and 10% of the salesmen, shop assistants and related workers are women. More than one-fourth of the quarrymen are women. Even though women are better suited than men by temperament and voice to be telephone operators, only slightly more than one-fourth of telephone operators are women. In all the occupations relating to spinning, women workers form nearly half of the total workers. In the occupations of cheerot, cigar and bidi making, basket weaving, packers, house-keepers, cooks, maids and related workers, and launderers, women form nearly half of the total workers in each of these occupations.

## Part—H

## Educational Composition of the Working Force

## General

146. 65·8% of the working force of this State are illiterates, and 24·7% are mere literates without any educational standard. The persons possessing Primary or Junior Basic qualification form 6·4% of the total workers. All the other educational standards together account for only 3·1% of workers.

As wide disparity in the educational standards of urban and rural population and males and females exists, the analysis will be done separately for urban and rural areas and separately for males and females. The educational composition of workers in urban area will be considered first.

## Urban area

147. The following table presents the distribution of workers in each sex by educational levels.

TABLE XII—78

## Percentage Distribution of workers of each sex by educational level in urban areas of Madras State

	Persons	Males	Females
Illiterates ...	39·5	28·5	80·3
Literates ...	32·2	38·2	9·9
Primary or Junior Basic	16·9	20·0	5·5
Matriculation ...	9·2	10·8	3·5
Technical diploma holders both equal and non-equal to degree	0·7	0·7	0·5
Degree other than technical degree	1·4	1·7	0·3

It can be seen that 39·5% i.e., slightly more than one-third of the urban working force are illiterates. Though among the total male workers only one-fourth (28·5%) are illiterates, among the female workers more than three-fourths (80·3%) are illiterates. Many stop their education with Matric as that educational level constitutes the minimum required for most of the clerical and executive jobs. Only one-tenth of (10·8) male workers are matrices and among female workers only 3·5% are Matric qualified. The workers possessing degree or Post-Graduate degree other than technical degree amount to only 1·4% of the total working force of the State.

It is significant that while only 0·5% of the male workers possess technical degree or diploma equal to degree, even among female workers persons possessing technical degree or diploma equal to degree account for 0·4%. This is due to the fact that many females work as teachers after attaining degree or diploma equal to degree in teaching. Out of all the seven branches classified under this group 'Technical degree or diploma equal to degree or Post-Graduate degree' the branch of 'Teaching' alone accounts for 72% among the female workers.

## District-wise analysis of the educational level of workers

148. The following table presents the distribution of workers in each sex by educational levels in each district:

# MADRAS STATE

Distribution of 1000 Workers of Each Sex into Illiterate and Literate and Educated Persons

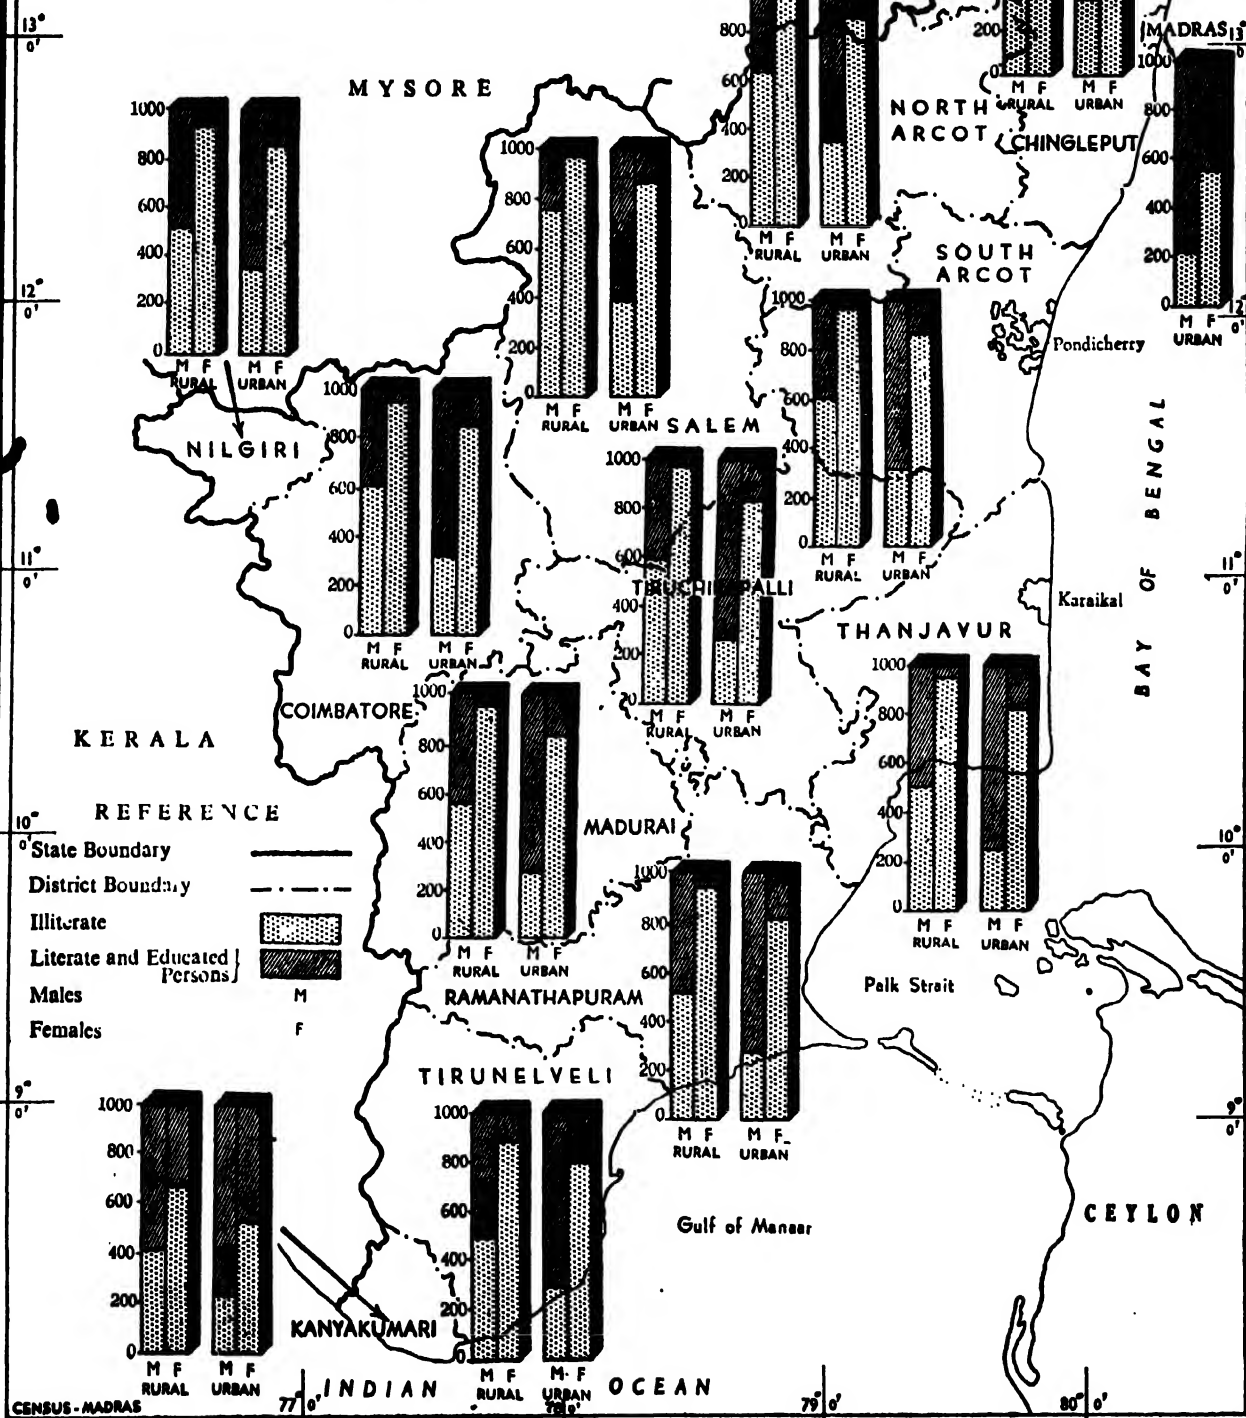

TABLE XII—79

Proportion of workers of each sex in different educational levels in the urban areas of the districts of Madras State

State/District	Illiterate		Literate (without educational level)		Primary or Junior Basic		Matriculation or Higher Secondary		Technical diploma both equal and non-equal to degree		University degree or post graduate degree other than technical degree	
	M	F	M	F	M	F	M	F	M	F	M	F
	1	2	3	4	5	6	7	8	9	10	11	12
<b>Madras State</b> ...	<b>285</b>	<b>803</b>	<b>382</b>	<b>99</b>	<b>200</b>	<b>55</b>	<b>108</b>	<b>35</b>	<b>7</b>	<b>5</b>	<b>17</b>	<b>3</b>
<b>Madras</b> ...	222	556	248	99	291	133	182	165	14	23	42	21
<b>Chingleput</b> ...	314	837	399	79	153	45	112	34	7	3	15	2
<b>North Arcot</b> ...	344	851	395	68	170	44	78	32	5	3	8	2
<b>South Arcot</b> ...	315	861	417	65	147	43	97	26	11	4	12	1
<b>Salem</b> ...	384	862	366	83	163	38	75	15	4	1	8	1
<b>Coimbatore</b> ...	321	851	366	79	201	42	94	23	6	3	12	2
<b>Nilgiri</b> ...	350	844	311	77	226	48	92	25	6	4	15	2
<b>Madurai</b> ...	265	823	435	86	195	56	87	29	5	4	13	2
<b>Tiruchirappalli</b> ...	268	828	388	83	206	48	116	34	9	4	12	3
<b>Tanjavur</b> ...	247	820	440	88	191	52	104	34	8	4	9	2
<b>Ramanathapuram</b> ...	265	805	482	123	150	53	80	17	7	2	8	...
<b>Tirunelveli</b> ...	292	785	486	149	141	45	68	16	5	3	8	1
<b>Kanyakumari</b> ...	235	528	469	297	182	104	82	55	9	8	21	5

The lowest proportion of illiteracy among male workers is in Madras district where only 22.2% of the male workers are illiterates. Madras being a cosmopolitan city containing persons of various languages even many of the casual labourers are literates though they have not attained any educational standard. For almost all grades and cadres of posts in the Government offices and in most of the other establishments of the city, men who can at least read and write only are employed.

Kanyakumari district with 52.8% illiterates has the lowest proportion of illiteracy among the female workers of the district. This district represents the picture of Kerala which has the highest literacy rate in India.

#### Technical qualifications among workers

149. In the State the male workers possessing technical diploma not equal to degree form only

0.2% of total male workers and female workers form 0.1% of total female workers. Out of the total males and females possessing this qualification 66.5% and 55.5% respectively are workers. In seven out of the 13 districts, namely South Arcot, Salem, Madurai, Tanjavur, Ramnad, Tirunelveli and Kanyakumari, the proportion of workers possessing technical diploma falls below 0.1% of the total workers of the respective districts, even among the male workers. Among the female workers, in South Arcot, Madurai, Tirunelveli and Kanyakumari districts the workers possessing technical diploma not equal to degree account for 0.1% of the total workers of the respective districts. In Madras district alone they form 0.2% of the total female workers. Of the total males who have technical degree or post-graduate degree 85.7% are workers and among females 79.7% are workers. It is only among

the females who have technical degree or technical or non-technical diploma, the proportion of workers is high, as compared to the females of other educational standards. Among the female university degree holders only 29% are workers.

Data relating to persons possessing technical degree or diploma equal to degree were classified under six important technical branches of science. The statement given below shows the districts in which no worker with any of these technical qualification has been recorded.

Statement showing the districts which have no figures in the sub-heads coming under  
'Technical degree or diploma equal to degree or Post-graduate degree'

Name of the District	Engineering	Medicine	Agriculture	Veterinary and Dairying	Technology	Teaching	Others
	F		F	F	M	F	M
Madras City	...	...	\	...	...	x	...
Chingleput	...	...	x	x	...	x	...
North Arcot	...	...	...	...	...	x	...
South Arcot	...	...	x	x	x	x	...
Salem	...	...	x	x	...	x	...
Coimbatore	...	...	...	x	...	x	...
Nilgiri	...	...	...	x	x	x	...
Madurai	...	...	...	x	...	x	...
Tiruchirappalli	...	...	x	x	...	...	...
Thanjavur	x	...	x	x	...	x	...
Ramanathapuram	x	...	x	x	...	x	...
Tirunelveli	x	...	x	x	...	x	...
Kanyakumari	x	...	...	x	x	x	...

It can be seen that it is only among the female workers, in most of the districts none are found qualified in these technical branches.

Among the branches coming under this group, teaching alone accounts for 43.6%. Next to it come workers with qualification in Engineering who form 23.4% of the group and workers with qualification in Medicine account for 19.5%. Among the males those possessing degrees of 'Teaching and Engineering' account for the larger share of persons coming under this group and among females 'Teaching' alone accounts for nearly three-fourths. Medicine is the only other branch which accounts for a significant proportion.

### Engineering

150. Among the male workers in the districts the proportion of persons holding degree or diploma in Engineering is only 0.4% in Madras district and in South Arcot district. The Neyveli Lignite Corporation in South Arcot has provided employment for a larger number of Engineers. It can be seen that out of the 279 workers possessing degree or diploma equal to degree in engineering, working in the category of mining in the State, 241 are in South Arcot district. In all the other districts, the proportion of workers with this qualification amounts to only 0.1% of the total workers of the respective districts. The female

workers possessing Engineering degree are negligible. There are only 33 females in the State with this qualification and out of it only 22 are workers. 8 out of the 22 are in Madras district. Except in the districts of Salem, Thanjavur, Ramanathapuram, Tirunelveli and Kanyakumari, in all the other districts females possessing degree in Engineering are found.

### Medicine

151. The proportion of male and female workers with qualification of degree or diploma equal to degree in medicine to the total workers in the State is only 0.1%. Out of every ten thousand persons there are only 3 physicians in the urban area. It is seen that 14 males and 1 female with qualification of degree in medicine come under the category of 'cultivators'. These may most probably be engaged in directing or supervising cultivation of their own land after retirement from active service. 12 out of these 14 males are in Tirunelveli district and the solitary case of a female with this qualification coming under the category of cultivators is in Madurai district. Two male workers, one in North Arcot district and one in Madurai district, possessing this educational qualification are primarily engaged in household industry. The manufacture of Ayurvedic, Unani medicines and other pharmaceutical preparations is also one of the household industries. It may be that these two persons are primarily occupied in such a household industry or in any other household industry after retirement from effective service. While 6.9% of the male workers possessing degree in medicine are found in the categories other than 'Other Services' only 1.9% among female workers with this qualification are recorded in the other categories. This shows that few female doctors are employed in other companies or offices relating to the sectors of mining, manufacturing, trade and commerce and transport.

### Agriculture

152. The persons possessing degree or diploma equivalent to degree or post-graduate degree in Agriculture form only 3.4% even among

those possessing technical degree or diploma equal to degree or post-graduate degree. The females possessing this qualification are in North Arcot, Coimbatore, Nilgiri, Madurai and Kanyakumari districts. Out of the 12 females possessing this qualification in Agriculture in the urban area of the State, only 3 are workers. It is known from the Union Table B-VIII Part-A that no female with this qualification has been recorded as unemployed. Female attaining degree in technical courses like Agriculture is only a feature of the recent times and hence they may not be persons retired from employment. Most probably most of them will be belonging to the category of 'Housewife'. To whatever class of non-workers they belong, it is most likely that their technical knowledge is not being fully utilised as they are not employed.

Nearly one-third of the holders of this qualification is in Coimbatore district. It is significant that the only agricultural college of the State lies in Coimbatore district.

### Veterinary and Dairying

153. Both in the State and in the districts the proportion of workers with this qualification falls even below 0.1% among male workers and female workers.

### Technology

154. Persons with this standard of qualification in technology form the least proportion of 1% among the total persons possessing technical degree. In the three districts of South Arcot, Nilgiris, and Kanyakumari none possesses this qualification. Only 2 females are qualified in this branch and they are in Tiruchirappalli district and both of them are non-workers and they also do not belong to the classification of 'unemployed' among the non-workers.

### Teaching

155. In one of the most important branch of science namely, the branch of instructing and imparting knowledge, (Teaching) 8,029 persons in

the urban areas of the State are qualified with a degree or diploma equal to degree or post-graduate degree. As already stated this particular branch has the largest proportion of 43·6% persons coming under the major classification of persons with 'Technical qualification'. 37% of the total males and 71·8% of the total females having technical qualification are holders of degree or diploma equal to degree in Teaching.

### Category-wise analysis of the educational level of workers

156. Subsidiary Table B-III Part A-2 presents the distribution of 1,000 workers in each industrial category by educational levels in urban areas for males and females separately. The educational level which has the highest proportion and that which has the lowest proportion in each industrial category has been listed out below for males and females separately for the State :

### MADRAS STATE

		Males	Females
Cultivators :	Highest :	Literate (43·2) (w.e.l.)	Illiterates (89·9)
	Least :	University Degree (0·3)	Matriculation or Higher Secondary (0·2)
Agricultural labourers	Highest :	Illiterate (71·6)	Illiterate (96·5)
	Least :	Matriculation or Higher Secondary (0·2)	Primary or Junior Basic (0·6)
Mining :	Highest :	Illiterate (54·5)	Illiterate (91·8)
	Least :	Technical Diploma not equal to Degree (0·3)	Matriculation or Higher Secondary (0·2)
Household Industry	Highest :	Literate (w.e.l.) (51·9)	Illiterate (77·4)
	Least :	Matriculation or Higher Secondary (0·7)	Matriculation or Higher Secondary (0·1)
Manufacturing	Highest :	Literate (w.e.l.) (41·9)	Illiterate (81·3)
	Least :	Technical Diploma (0·3)	University Degree or Post-Graduate other than Technical Degree (0·5)
Construction	Highest :	Literate (w.e.l.) (37·1)	Illiterate (93·0)
	Least :	Non-technical Diploma not equal to Degree (0·1)	University Degree or Post-Graduate Degree other than Technical Degree (0·1)
Trade and Commerce	Highest :	Literate (w.e.l.) (44·9)	Illiterate (86·6)
	Least :	University Degree (1·9)	University Degree (0·3)
Transport :	Highest :	Literate (w.e.l.) (30·8)	Illiterate (52·9)
	Least :	Technical Diploma (0·3)	Non Technical Diploma (0·1)
Other Services	Highest :	Literate (w.e.l.) (30·4)	Illiterate (70·9)
	Least :	Non-technical Diploma (0·2)	Technical Diploma (0·2)

w.e.l. -- Without educational level.

**Percentage Distribution of Male Workers in Urban Areas  
of Madras State by Educational Levels**

**Percentage Distribution of Female Workers in Urban Areas  
of Madras State by Educational Levels**

**LEGEND**

**Cultivators**

157. Among 'Cultivators' 40.7% of male workers are illiterates and 43.2% are mere literates without any educational standard and 89.9% of female workers are illiterates and 7.7% are mere literates. Though in the category of 'Cultivators' men of all educational standards are found, they form a very small proportion and even they may be persons engaged in direction or supervision. The following statement gives the proportion in terms of percentage of cultivators classified by educational level in urban areas.

**Cultivators—100.00**

Educational level	Males	Females
Illiterates	40.7	89.9
Literates (without educational level)	43.2	7.7
Primary or Junior Basic	12.1	2.2
Matriculation or Higher Secondary	3.7	0.2
Technical diploma not equal to degree	...	...
Non-Technical diploma not equal to degree	...	...
University degree or post-graduate degree other than technical degree	0.3	...
Technical degree or diploma equal to degree or post-graduate degree	...	...

Among the districts, the highest proportion of illiterates among cultivators is in Salem district (62.5% males and 95.2% females) and the lowest in Kanyakumari district (16.0% males and 43.8% females). Only in Kanyakumari district 8.3% of male workers and 1.8% of female workers of this category are Matriculates. Kanyakumari district has the highest percentage of literacy and the employment opportunities in this district are also limited.

**Agricultural Labourer**

158. The poorer section of the people who only take up the work of labourer in agricultural activities neither have the means nor the opportunity to spend money and time in education. The hunger for knowledge whether it exists or not in them, the hunger for food is the dominant factor which sets the pattern of their career. Hence, it is not surprising that in the category of agricultural labourer, 71.6% of the male workers and 96.5% of the female workers are illiterates. In no other category such a high proportion of illiterates is found. Even among the remaining population of this category, most of them are just literates without any educational qualification.

The literates with educational qualification amount to only 4.3% of male workers and only 0.6% of female workers of this category. The following statement gives the proportion in terms of percentage of agricultural labourers classified by educational level in urban areas.

**Agricultural Labourers—100.00**

Educational level	Males	Females
Illiterates	71.6	96.5
Literates (without educational level)	24.1	2.9
Primary or Junior Basic	4.1	0.6
Matriculation or Higher Secondary	0.2	...
Technical diploma not equal to degree	...	...
Non-Technical diploma not equal to degree	...	...
University degree or post-graduate degree other than technical degree	...	...
Technical degree or diploma equal to degree or post-graduate degree	...	...

The proportion of illiterates in the districts, in this category, ranges from 40.3% in Madras and

Kanyakumari districts to 82.7% in Salem among males and 69.5% in Kanyakumari district to that of cent per cent illiterates in Madras district among females.

### Mining and Quarrying

159. In this category 54.5% of the male workers and 91.8% of the female workers are illiterates. In the non-agricultural sector, it is only in this category such a high proportion of illiterates among male workers is found. Among female workers in the non-agricultural sector this proportion of illiteracy is exceeded by only that of the female workers in the category of 'Construction' in which 93% are illiterates. The greater proportion of workers of this category is only manual labourers and hence the proportion of illiterates is high, as compared to the other categories. The following statement gives the proportion in terms of percentage of Mining and Quarrying workers classified by educational level in urban areas.

#### Workers in Mining and Quarrying—100.00

Educational level	Males	Females
Illiterates	54.5	91.8
Literates (without educational level)	31.5	6.9
Primary or Junior Basic	8.1	1.1
Matriculation or Higher Secondary	4.6	0.2
Technical [diploma not equal to degree	0.3	...
Non-Technical [diploma not equal to degree	...	...
University degree or post-graduate degree other than technical degree	0.6	...
Technical degree or diploma equal to degree or post-graduate degree	0.4	...

The proportion of illiterates in this category ranges from 34.3% in South Arcot district to

62.2% in Kanyakumari district among males and from 73% in Madras district to 97.6% in North Arcot district among females. The University degree holders form 0.6% of male workers of this category and there are only 7 female workers possessing University degree. The proportion of University degree holders among male workers of this category ranges from 2.5% in South Arcot district to 0.2% in Chingleput district. The Neyveli Lignite Corporation of South Arcot district employs many degree holders and technically qualified personnel and hence the proportion of male workers of these educational standards is high in this district as compared to the other districts.

### Household Industry

160. The Household Industry is mainly an avenue of employment for poorer section of people. The following statement gives the proportion in terms of percentage of household industry workers classified by educational level in urban areas.

#### Workers in Household Industry—100.00

Educational level	Males	Females
Illiterates	34.7	77.4
Literates (without educational level)	51.9	17.6
Primary or Junior Basic	12.7	4.9
Matriculation or Higher Secondary	0.7	0.1
Technical diploma not equal to degree	...	...
Non-Technical diploma not equal to degree	...	...
University degree or post-graduate degree other than technical degree	...	...
Technical degree or diploma equal to degree or post-graduate degree	...	...

Majority of the male workers of this category are literates though they have not attained any educational standard. But among female workers, as in every other category, illiterates form the largest proportion of 77.4%. It is noteworthy that 2 female non-technical degree holders and one female degree holder in teaching are engaged in household industry. These cases are found in Madras district. 0.7% of the male workers of this category are Matriculates and among the female workers 0.1% are Matriculates. In the non-agricultural sector this category has the lowest proportion of Matriculates among male workers and female workers.

### Manufacturing

161. Manufacturing other than household industry is mostly done in big factories and companies which provide sufficient scope for administrative and executive jobs in addition to the technical and non-technical work in the productive side. Hence persons of almost all the different educational standards are found in this category. The following statement gives the proportion in terms of percentage of manufacturing workers classified by educational level in urban areas.

#### Workers in Manufacturing—100.00

Educational level	Males	Females
Illiterates	23.2	81.3
Literates (without educational level)	41.9	12.6
Primary or Junior Basic	25.1	4.8
Matriculation or Higher Secondary	8.5	1.2
Technical diploma not equal to degree	0.3	...
Non-Technical diploma not equal to degree	...	...
University degree or post-graduate degree other than technical degree	0.9	1
Technical degree or diploma equal to degree or post-graduate degree	0.1	...

The proportion of Matriculates in the districts among the male workers and female workers of this category is high in Madras and Chingleput districts. 15.8% of male workers and 11.8% female workers of this category in Madras district are Matriculates and 12.9% male workers and 3.6% female workers are Matriculates in Chingleput district. Many big manufacturing establishments are situated in the suburbs of Madras City which come under Chingleput district. Female University degree holders of this category are found only in Madras, Chingleput, Madurai, Tiruchirapalli and Coimbatore.

### Construction

162. The construction work needs in addition to brick, mortar and labour, the planning and designing by technically qualified personnel. Persons possessing technical degree form 1.2% of the male workers of this category. In the rest of the categories excepting 'Other Services', the workers with technical qualification form less than 1%. Of the total male technical degree holders working in this category, 98% are qualified in Engineering which is indeed natural. Two female degree holders in Engineering are found in Madras district. Out of the total male workers possessing this degree, engaged in this sector, 45% are in Madras district and 10% in Coimbatore district. The following statement gives the proportion, in terms of percentage of construction workers classified by educational level in urban areas.

#### Workers in Construction—100.00

Educational level	Males	Females
Illiterates	35.4	93.0
Literates (without educational level)	37.1	4.6
Primary or Junior Basic	16.7	1.2
Matriculation or Higher Secondary	8.2	1.1

Educational level	Males	Females
Technical diploma not equal to degree	0.8	...
Non-Technical diploma not equal to degree	0.1	...
University degree or post-graduate degree other than technical degree	0.5	0.1
Technical degree or diploma equal to degree or post-graduate degree	1.2	...

In the non-agricultural sector it is in the category of construction the highest proportion of illiterates is found among the female workers. The proportion of technical diploma holders among male workers in this category is also the highest as compared to the other categories though it is only 0.8%. In the districts among the male workers of this category, Matrics form the highest proportion of 12.1 % in Tiruchirapalli district and among the female workers the Matrics form the highest proportion of 16.7% in Kanyakumari district.

### Trade and Commerce

163. This vital sector not only includes the street hawker and petty shop owner, most of whom are illiterates, but also the trim salesman who promotes the sales by the eloquence and manner of his speech and conduct and also the big executive who controls vast number of commercial establishments. Only 13.1 % of male workers of this category are illiterates which is the lowest proportion of illiteracy as compared to the other categories. The following statement gives the proportion in terms of percentage of trade and commerce workers classified by educational level in urban areas.

Workers in Trade and Commerce—100.00		
Educational level	Males	Females
Illiterates	13.1	86.6
Literates (without educational level)	44.9	8.6
Primary or Junior Basic	26.5	2.8
Matriculation or Higher Secondary	13.5	1.7
Technical diploma not equal to degree	...	...
Non-Technical diploma not equal to degree	...	...
University degree or post-graduate degree other than technical degree	1.9	0.3
Technical degree or diploma equal to degree or post-graduate degree	0.1	...

Out of the 5 females qualified with degree in teaching employed in this category, 4 are in Madras and 1 in Salem. The highest proportion is in Salem district, both among male and female workers. The proportion of male university degree holders in this category ranges from 4.9% in Madras district to 0.6% in South Arcot district. Among female degree holders who are workers in the State 5.7% are in this category and out of these 85.6% are in Madras district. Madras being the centre of commercial and trading activities in the State, has many commercial establishments in which on the clerical and executive side girls are employed. Female degree holders in this category are found only in Madras, Chingleput, Coimbatore, Madurai, Tiruchirapalli and Thanjavur districts.

### Transport, Storage and Communication

164. This activity has the highest proportion of Matriculates among both the male and female workers of this category. 19.5% and 28.4% of male and female workers of 'this category respectively' are Matriculates. The following statement gives

the proportion in terms of percentage of transport, storage and communication workers classified by educational level in urban areas.

**Workers in Transport, Storage and Communication—100·00**

Educational level	Males	Females
Illiterates	24·1	52·9
Literates (without educational level)	30·8	8·7
Primary or Junior Basic	22·8	5·7
Matriculation or Higher Secondary	19·5	28·4
Technical diploma not equal to degree	0·3	...
Non-Technical diploma not equal to degree	...	0·1
University degree or post-graduate degree other than technical degree	2·3	3·5
Technical degree or diploma equal to degree or post-graduate degree	0·2	0·7

The University degree holders form 2·3% and 3·5% among male and female workers of this category. In no other category the female degree holders form such a high proportion of the particular category. It is interesting to note that there are 4 females qualified in Engineering, working in this sector and all the four are in Madras. 46 males and 18 females qualified in teaching, who form 0·9% both among total male workers and total female workers having degree in teaching, are found in this category, and they are mostly found in Madras and Tiruchirapalli districts. They may be teachers employed in railway schools. There are 3 females who are technical diploma holders working in this category, two in Madras and one in Tiruchirapalli.

**Other Services**

165. This category includes Government service, other professional services like legal, educa-

tional services and also general labourers, loaders and unloaders, domestic servants, cooks, hotel servants, etc. It includes not only activities where talent of the highest order is required, but also activities where mere physical strength is a necessity. As such, except among the mere literates, primary or junior basic qualified persons and persons qualified with a degree in technology, in cases of all the other educational standards the highest proportion of workers come under 'Other Services'. The following statement gives the proportion in terms of percentage of other services workers classified by educational level in urban areas.

**Workers in Other Services—100·00**

Educational level	Males	Females
Illiterates	29·2	70·9
Literates (without educational level)	30·4	7·2
Primary or Junior Basic	19·2	10·2
Matriculation or Higher Secondary	15·6	9·5
Technical diploma not equal to degree	0·4	0·2
Non-Technical diploma not equal to degree	0·2	...
University degree or post-graduate degree other than technical degree	3·5	0·8
Technical degree or diploma equal to degree or post-graduate degree	1·5	1·2

**Educational level of workers in rural areas**

166. While half of the urban population are illiterates, three-fourth of the rural population are illiterates. It may be recalled that 49·6% are workers in the rural area. The following statement presents the comparative proportions of workers in urban and rural areas for each educational level:

Educational level	Rural workers			Urban workers		
	P	M	F	P	M	F
Illiterates ...	72.4	59.0	94.8	39.5	28.5	80.3
Literates ...	22.9	34.0	4.2	32.2	38.2	9.9
Primary or Junior Basic ..	3.8	5.5	0.9	16.9	20.0	5.5
Matriculation and above	0.9	1.5	0.1	11.3	13.2	4.3

The statement above presents vividly the contrast between these two areas in the level of literacy among workers. Nearly three-fourth of rural workers (72.4%) are illiterates while in the urban area only one-third (39.5%) of the urban working force are illiterates. The workers with qualification of matric and above just form 0.9% of the rural workers. This is because still the occupation in rural areas is not diversified and more than 60% of workers in the rural areas are workers in the agricultural sector.

Among the females it is from the rank of illiterates the highest percentage (39.8%) is workers. Out of the female literates only 16.8% are workers. From this it can be inferred that their illiteracy and their status as workers may both be due to poverty. Among the total male workers of the districts, the proportion of illiterates varies from 42.2% in Kanyakumari district to 75.3% in Salem district. It may be recalled that in Salem rural areas 75.5% of workers are in the agricultural sector whereas in Kanyakumari district rural areas 32.9% of workers are working in the agricultural sector. Except in Kanyakumari district, in all the other districts more than three-fourth of the female workers are illiterates in the rural area. Among the total male workers of the districts, the proportion of literates ranges from 19.8% in Salem district to 44.6% in Tirunelveli district. Among the female workers excepting in Tirunelveli and Kanyakumari districts, the proportion ranges only below 6%.

Only 4.4% of the rural population in contrast to the 16.5% of the urban population are quali-

fied with Primary or Junior Basic educational standard. Among the total persons possessing Primary or Junior Basic educational standard 42.7% consisting of 51.7% of the males and 15.5% of the females of this qualification are workers and these are the lowest as compared to male and female workers among illiterates, literates, and persons possessing Matriculation and above.

In the districts, the proportions of male workers having qualification of Matriculation and above to the total workers of the districts vary from 0.9% in Salem district to 5% in Nilgiri district. The corresponding proportion of female workers in the districts ranges from 0.1% in Salem and South Arcot districts to 2% in Kanyakumari district. It is interesting to note that 994 male and 32 female workers possessing qualification of Matriculation and above work as agricultural labourers in the rural areas of the State. They constitute 0.9% and 0.4% of total male and female workers possessing this qualification. Male workers under this educational classification working as agricultural labourers are in every district and excepting in the districts of North Arcot and Nilgiri, in all the other districts cases of such female workers are also found. The highest number of such male and female workers is found in Thanjavur district. 155 males and 7 females constituting 1.1% and 2% of total male and female workers having the educational qualification of Matriculation and above are in Thanjavur district. In each of the 4 districts namely Thanjavur, Madurai, Coimbatore and Tiruchirapalli, in the rural areas, more than 100 males possessing the educational

**Percentage Distribution of Male Workers in Rural Areas  
of Madras State by Educational Levels.**

**Percentage Distribution of Female Workers in Rural Areas  
of Madras State by Educational Levels.**

**LEGEND**

qualification of Matriculation and above are working as agricultural labourers. 210 males and 3 females in the urban area of the State possessing qualification of Matriculation have also been recorded as working as agricultural labourers. Most of these cases may be due to the erroneous inclusion by enumerators of persons who might have informed that they look after cultivation of the lands of their family or others on payment of salary. 748 males and 296 females possessing Matriculation qualification constituting 0.7% of male and 4.1% of female workers of this educational attainment are recorded under household industry. In the urban area the number of males with Matriculation qualification alone engaged in

household industry is nearly double that of the rural area (1,352) and the corresponding number of females (257) is almost the same in rural area (296). Next to that of other services, it is only in household industry the greater proportion of female workers coming under this educational classification are found in rural areas. Both among male and female workers of this educational classification in all the districts figures have been recorded under household industry, the highest being 150 males in Coimbatore district and 114 females in Kanyakumari district.

In this Chapter, I have given only a brief account of the educational attainments of workers. Detailed discussions will be found in the Chapter on literacy.

## Part—I

### Status or Class of worker

#### Definition

167. I have earlier defined the status or class of worker as in 1961 Census. This classification has been presented in one table only, Table B-IV parts A, B & C. The worker is divided into 4 classes, namely, Employer, Employee, Single Worker and Family Worker. The single worker in Indian Census has a different connotation from the U.N.'s 'Own account worker'. Own account worker is defined in U.N. Manual as 'a person who operates his (or her) own economic enterprise or engages independently in a profession or trade and hires no employee'. Single worker in Indian Census, 1961 has been defined as a person who did his work without employing others except casually and without the help of other members of the family. A person who works in joint partner-

ship with one or several persons hiring no employees and also a member of producer's co-operative is treated as single worker. But as per U.N. classification, the member of producer's co-operative forms a separate class. However, in both U.N. classification of Own account worker and Indian classification of Single worker, the emphasis is the same, that is, it should denote the persons who work independently without employing any others.

#### Distribution of workers in industrial division according to class of workers

168. The following table presents the distribution of 1,000 workers of each sex in each Industrial Division and Major Group among the class of workers.

TABLE XII-80  
*Distribution of 1,000 workers of each sex in Industrial Division and Major Group among Employers  
 Employees, Single workers, Family workers and Others*

In Household Industry, the proportion of 'Others' forms the major portion and the employees form only a very insignificant proportion. The main element of household industry is the limited role of hired workers. In the non-household industry, the proportion of employees is greater both among male and female workers in Divisions relating to Mining and quarrying (Division 1), Manufacturing (Divisions 2 & 3), Electricity, Gas, water and sanitary services (Division 5) and Transport, storage and communication (Division 7) and greater in the case of female workers only in Division 0 relating to Agriculture, livestock, forestry, fishing and hunting. Single worker forms the highest proportion in the case of both male and female workers in Divisions relating to Construction (Division 4), Trade and Commerce (Division 6), Services (Division 8) and Activities not adequately described (Division 9).

#### **Class of worker in Household Industry**

169. 18% form employees out of the total workers engaged in household industry in the State. Whereas in the urban areas employees form 23% of the total workers in household industry, in rural areas, the employees form only 16%. In the rural areas, the assistance of other members of the household can be used thereby reducing the number of hired workers.

For the same reason the employees form lesser proportion among female workers than among male workers. Whereas in the rural and urban areas female employees in Household Industry form 12.7% and 21.3% respectively of the female workers, the male employees form 18.2% and 24.3%. In the State, among males it is in the household industry relating to manufacture of tobacco products and among females in the household industry relating to manufacture of chemicals and chemical products the employees form a very large proportion. About 45% of the total male workers in the household industries relating to tobacco products and about 75% of the total female workers in the household industries relating to manufacture of

chemicals and chemical products, are employees. Manufacture of matches is included in the industrial groups of chemicals and chemical products and in many of the household industries relating to matches manufacturing, many females are employed. The role of employees is the least in household industry relating to fishing among male workers, being only 5% out of the total male workers in this household industry and in household industry relating to non-metallic mineral products other than petroleum and coal among female workers being only 4-6%.

Among the districts of the State, it is in Madurai the employees form the highest proportion of more than one-fourth i.e., 27.6% of the total workers engaged in household industry. When only male workers are taken into consideration, Madras (29%) has the highest proportion of employees among other districts and among female workers Madurai (26.2%) has the highest proportion.

#### **Comparison of the strength in each class of worker in Household Industry with that of non-Household Industry**

170. It is interesting to compare the proportion of employees in household industry and in non-household industry. While 18% of the workers only are employees in household industry, 45.2% are employees in non-household industry. Among the non-household industry, single workers and employees form the major part of workers. 46.8% of the workers are single workers in the State. The role of family workers is negligible in non-household industry being only 2.1%. Employers form 5.9%.

Among the districts of the State in non-household industry, trade, business, profession or service the proportion of employees is the lowest only in Kanyakumari district (28.5%) and highest in Nilgiri district. Such low proportion of employees in Kanyakumari can be explained by the fact that fishing is the main occupation. A high proportion of 70% of workers in non-household industry has been recorded as employees in Nilgiri as it has a large number of tea estates.

### **Class of worker in Non-household Industry, Trade Business, etc.**

171. Single workers form 47% of the total workers of the State engaged in non-household industry, trade, business, profession or service. The lowest proportion of single workers, 24.3 is found in Nilgiri district and the highest proportion of 65.4 in Kanyakumari district. In the urban areas the proportion of single workers does not exceed one-third of the total workers except in Kanyakumari and South Arcot district. The proportion in the urban areas of the State amounts to only 32.8%. The lowest proportion in urban area is again found in Nilgiri and Madras.

It will be significant to compare the proportion of single worker and family worker in the categories of III and V to IX. The family workers form only 2% in the State, the highest being in Tirunelveli district (3.8%) and the lowest being in Madras (0.8%). Normally it is only in the rural areas members of the same family assist in the work done by the head of the household. The family workers form only 1.8% in the urban areas of the State.

### **Class of worker in the category of Mining, Quarrying, etc.**

172. The proportion of all classes of workers in each of the categories of III and V to IX will be considered below. In the category of mining, quarrying, livestock, fishing, hunting and plantations, half of the workers are employees and 42% are single workers.

### **Class of worker in the category of Manufacturing other than Household Industry**

173. In industrial establishments other than household industries, it is natural that employees form the major part of workers. Coimbatore and Madras which are the big industrial centres of the State have 79% and 76.8% respectively of employees out of the total workers. The lowest proportion of employees amounts to 50.3% in Thanjavur district. On an average in the State,

the proportion of employers to employees among the total workers belonging to categories III and V to IX, works out to 8 employees for one employer. In the category of manufacturing, the proportion amounts to 13 for one employer. It can be seen that in Coimbatore and Madras the proportions are as high as 22 and 20 respectively for one employer. These two towns have many large-scale factories and industries wherein hundreds of workers are employed. The lowest proportions are found in Thanjavur district, Nilgiri district and South Arcot district with 4, 5 and 7 respectively. Many industrial establishments are also situated in Chingleput district in suburban areas near Madras and in this district for every employer there are 17 employees in the category of manufacturing other than household industry.

### **Class of worker in the category of construction**

174. In the category of construction, the single workers and employees form the bulk of the workers viz. 55.8% and 42.4% respectively. The employers form only 1.6% of the total workers.

### **Class of worker in Trade and Commerce**

175. In the category of trade and commerce, the single workers form 41.5%. The employers form 22.3% and employees 32.9% in the State. Only in Madras district the employees in this category form 58.2%. Madras has big trading and commercial firms where many are employed and hence this high proportion. In all other districts, the single workers form the highest proportion. Most of the small shops are run by owners themselves.

### **Class of worker in Transport, Storage and Communication**

176. It is but natural that in the category of transport, storage and communications, the employees form three-fourth of the total workers.

**Class of worker in 'Other Services'**

177. In the category of other services also single workers form 58.9%. This high proportion is mainly due to the inclusion of general labourers in this category. In the religious and welfare services, legal services and in recreational services all of which are included in this category, the single workers form roughly 40 to 50%. The highest proportion of single workers in this category is found in Salem district (72.9%). This high proportion also is accounted for mainly by 89 group which relates to general and casual labourers who do not have any fixed place of work. Family workers form 1.9% and are mostly found in the group of personal services which includes domestic servants, hotels, and laundry services. The highest proportion of family workers in this category is found in Tirunelveli district where 5.1% are family workers.

**Single worker**

178. The industrial groups in which the single workers form more than half of the total workers are given below :

Major Group	30—Fishing	...	70.2%
„	28—Manufacture of wood and wooden products	...	65.4%
„	02—Forestry and logging	...	61.2%
Major Group	40—Construction	...	55.8%
„	84—Legal Services	...	54.9%
„	04—Livestock and Hunting	...	51.7%

That even in legal services the single workers form only 55% shows that even in this independent profession there is much inter-dependence. The proportion of single workers is the lowest in educational and scientific services, being 0.9%. In storage and warehousing also the proportion is only 5%. Surprisingly even in the industrial group relating to personal services, which includes services rendered by cooks, dhobies, barbers

and hotels, the proportion of single worker is only 39%. This may be due to the existence of big hotels which employ large number of staff.

**Family workers**

179. The family workers form one-tenth of the total workers only in the industrial group of fishing. In the groups of livestock and hunting and personal services they form 8.8% and 7.5% respectively and in all the other groups they form only less than 3%. In fishing, the family workers may be assisting in the transport and marketing of fish and in mending the fishing nets. Family workers play a significant part only in the agricultural sector.

**Employees**

180. Apart from the purely Governmental services where employees form cent per cent of the total workers, the highest proportion of employees is in storage and warehousing (93.7%) and in cotton textile industries (92.2%). The proportions of employees in the groups where they form more than 25% of the total workers are furnished below in the descending order :

**Major Groups in which employees form more than 25% of the workers**

Major Group	Employees	Major Group	Employees
50	100.00	37	84.43
73	100.00	29	83.15
80	100.00	38	81.38
81	98.75	22	79.70
51	96.72	25	78.82
72	93.72	21	77.08
23	92.24	69	74.35
01	89.97	82	70.92
86	89.80	85	70.30
30	89.22	83	70.18
26	87.12	70-71	69.39
32	85.43	34-35	63.04
33	85.43	20	60.38

Major Group	Employees	Major Group	Employees	Proportion of Employees to Employer			
				All Divisions		Divisions 2 & 3 only (Manufacturing Sector)	
87	59·58	84	42·55				
24	58·40	40	42·43	Nilgiri	21	Coimbatore	22
36	58·22	88	41·38	Madras	14	Madras	21
10	56·28	04	37·66	Chingleput	10	Chingleput	17
31	53·79	02	35·97	Coimbatore	9	Salem	14
39	52·68	00	32·44	Kanyakumari	9	Tirunelveli	14
60-63	51·26	28	29·36	South Arcot	8	Kanyakumari	13
90	47·04	64-68	27·56	Tiruchirapalli	7	Madurai	12
27	42·73			North Arcot	6	North Arcot	11
				Salem	6	Ramanathapuram	11
				Madurai	6	Tiruchirapalli	10
				Ramanathapuram	6	South Arcot	7
				Tirunelveli	6	Nilgiri	5
				Thanjavur	5	Thanjavur	4

The following statement presents the proportion of employees to employer.

## CHAPTER—XIII

### NON-WORKING POPULATION

#### General

1. In my discussion on workers, the concept of non-worker has been fully explained. In the past Censuses, it was possible to indicate the means of livelihood or occupation on which non-workers depended. In this Census, the earning dependent has been merged in the general category of non-workers. For the first time, however, a detailed classification of non-workers has been made by dividing them into eight categories. I am not, however, certain that all full-time students or children attending schools, housewives or persons attending to household duties, dependants or any other in the remaining five categories of non-working population have been fully accounted for under non-workers. This is the result of a somewhat generous definition of worker to which I have alluded to in detail in the previous chapter. It is therefore, possible that unemployment or under-employment in the State has been masked by the presence of a large number of workers.

#### Census question and instructions on non-workers

2. The discussion in this Chapter is based on Question No. 12. The relevant question and the instructions issued are reproduced below : —

“ Activity if not working :

(a) Question 12: This applies to persons who are not working, *i.e.*, those who are not engaged in cultivation, agricultural labour, household industry, trade, profession or service.

This category includes persons who are not active in the sense that they are not engaged in any productive work. Beggars, pensioners, persons receiving royalty from agricultural land or non-agricultural land, rent or dividend receivers, etc., (though they may be earning an income do not participate in any productive work) as well as inmates of institutions, convicts

in jail, disabled persons not working, etc., are classified as persons “ not working ”.

These persons have been grouped under eight different categories for Census purposes. Each group has to be indicated by authorised abbreviations as given below :

(b) To record an answer to this question, you should ask the person enumerated, the following questions. If the answer to the questions is in the affirmative you should indicate the group to which he belongs by the abbreviation mentioned against each :

	Authorised abbreviations
(i) Are you a full-time student or a child attending school who does no other work such as manufacturing articles at home for sale or helping your family in cultivation, industry, trade or business ?	ST
(ii) Are you a person engaged in unpaid household chores or housewife or adult woman who does no other work such as making articles at home for sale or wages or helps regularly even part-time in family cultivation, household industry, trade or business ?	HW
(iii) Any dependant including an infant or a child not attending school, a person permanently disabled from work because of illness, accident or old age.	D
(iv) A retired person who is not employed again, a person living on agricultural and non-agricultural royalty, rent or dividend receivers or any other person of independent means which does not necessitate any work on his part and who does no other work.	R

	Authorised abbreviations
(v) A beggar, vagrant or an independent woman without any indication of the source of income and others of unspecified source of existence.	B
(vi) A convict in jail or an inmate of a penal, mental or charitable institution.	I
<i>Note:</i> An under-trial prisoner will be shown as a worker if he used to do work before he was apprehended (work being defined in the sense we have done).	
(vii) A person who was not employed before but is seeking employment for the first time.	NE
(viii) A person employed before but now out of employment and seeking employment.	UN

### Tables dealing with Non-workers

3. The tables dealing with non-working population are :

1. Union Primary Census Abstract.
2. Table B-I Workers and Non-workers classified by sex and broad age-groups.
3. Table B-II Workers and Non-workers in cities, town-groups and towns arranged territorially classified by sex and broad age-groups.
4. Table B-III Part A Industrial classification of workers and non-workers by educational levels in urban areas only.
5. Table B-III Part B Industrial classification of workers and non-workers by educational levels in rural areas only.

6. Table B-VIII Part A Persons unemployed aged 15 and above by sex, broad age-groups and educational levels in urban areas only.
7. Table B-VIII Part B Persons unemployed aged 15 and above by sex and educational levels in rural areas only.
8. Table B-IX Persons not at work classified by sex, broad age-groups and type of activity.
9. Table C-VIII Part A Classification by literacy and industrial category of workers and non-workers among scheduled castes.
10. Table C-VIII Part B Classification by literacy and industrial category of workers and non-workers among scheduled tribes.
11. Table D-VI Distribution of industrial categories of workers and non-workers by place of birth.
12. Table SCT-I Part A Industrial classification of persons at work and non-workers by sex for scheduled castes.
13. Table SCT-I Part B Industrial classification of persons at work and non-workers by sex for scheduled tribes.
14. Table SC-I Persons not at work classified by sex, type of activity and educational levels for scheduled castes.
15. Table SI-II Persons not at work classified by sex and type of activity for scheduled tribes.

The corresponding subsidiary tables are indicated below :

- B-I-1 Distribution of 1,000 persons by each industrial category of worker and by non-worker and by sex.

B-III Part A-3	Distribution of 1,000 persons not at work by educational levels in urban areas only.	B-IX-2	Distribution of 1,000 persons not at work by age-groups.
B-III Part B-2	Distribution of 1,000 persons not at work by educational levels in rural areas only.	B-IX-3	Distribution of 1,000 persons not at work by sex and 1,000 non-workers of each sex by type of activity.
B-VIII Part A-1	Distribution of 1,000 males and females who are unemployed in each age-group according to educational levels in urban areas only.	C-VIII Part A-2	Distribution of 1,000 persons of all scheduled castes by categories of workers and non-workers.
B-VIII Part B-1	Distribution of 1,000 males and females who are unemployed by educational levels in rural areas only.	C-VIII Part B-2	Distribution of 1,000 persons of all scheduled tribes by categories of workers and non-workers.
B-IX-1	Number per 1,000 of population aged 15+ and of population of each age-group 15-34, 35-59, 60+ and age not stated who are unemployed separately for persons, males and females.	<b>Workers and Non-workers in India and States</b>	
		4. The table presented below gives the proportion of workers and non-workers per 1,000 of each sex in each age-group.	

TABLE XIII — 1

*Distribution of 1,000 of total population of each sex in each age-group among workers and non-workers, India and States, 1961*

India/States		Total Rural Urban	Age-group	Total Population		Total Workers		Total Non-workers			
				M	F	M	F	M	F		
1		2	3	4	5	6	7	8	9

Against the All-India proportion of 429 males and 720 females who are non-workers per 1,000 persons of each sex, Madras has recorded 403 males and 687 females. The rural and urban proportions are as follows :

	India		Madras	
	M	F	M	F
Rural	418	686	378	629
Urban	476	889	468	851

It would appear that the proportion of non-workers in Madras is lesser than in India. But actually it reflects the inclusion of a large number of persons under the category of cultivation and household industry resulting from the change in the concept of worker.

The highest proportion of non-workers is seen in the age-group 0-14 which is only natural. The proportion of non-workers in this age-group for the country as a whole works out to 906 for males and 934 for females. The corresponding proportion in Madras is 907 for males and 933 for females. The proportions of non-workers in this State in this age-group in both rural and urban areas are slightly lower than that of the corresponding proportions for the country as a whole. Except in Kerala, proportions of non-workers for both the sexes are higher in the urban sector in all States.

The proportion of child non-workers, i.e., in the age of 0-14 varies from State to State. In Kerala and West Bengal the demand for child labour is low. In States like Andhra Pradesh it is high. Madras lies between these two.

TABLE XIII—2

*Proportion of non-workers per 1,000 persons in 0-14 age-group by sex for States*

# **Distribution of Population between Workers and Non - workers in Madras State and Districts.**

## **LEGEND**

In Madras in the age-group 60+, 266 out of 1,000 males and 742 out of 1,000 females are non-workers. While the corresponding proportion for males in India is lower (234) than that of Madras, the corresponding proportion for females in India is higher than that of Madras. The proportion of non-workers in this age-group would to a limited extent indicate the economic

prosperity of the people. The low proportion of non-workers in this age-group would mean that people even after reaching the age of 60+ are driven to the necessity of working. The following table presents the proportion of non-workers in this age-group in the various States arranged in the descending order of proportions.

TABLE XIII—3

**Non-workers in rural areas**

6. The following statement presents the districts classified by those whose proportion of non-workers are above the State average and below the State average.

	Males	Females
State average ...	378	629
<b>Above State average</b>		
1. Kanyakumari ...	470	
2. Nilgiri ...	431	
3. Tirunelveli ...	405	
4. Ramanathapuram ...	398	
5. Thanjavur ...	386	
6. North Arcot ...	385	
7. Chingleput ...	378	
<b>Below State average</b>		
1. South Arcot ...	374	
2. Madurai ...	372	
3. Salem ...	360	
4. Tiruchirapalli ...	356	
5. Coimbatore ...	350	
<b>Above State average</b>		
1. Kanyakumari ...	818	
2. Chingleput ...	715	
3. Thanjavur ...	714	
4. South Arcot ...	671	
<b>Below State average</b>		
1. North Arcot ...	615	
2. Madurai ...	615	
3. Tirunelveli ...	608	
4. Coimbatore ...	607	
5. Nilgiri ...	576	
6. Tiruchirapalli ...	570	
7. Salem ...	568	
8. Ramanathapuram ...	562	

In the rural areas of the State as a whole, in the age-group of 0-14, 889 males out of 1,000 males and 918 females out of 1,000 females are non-

workers. The position of the districts is as follows.

	Males	Females
State average ...	889	918
<b>Above State average</b>		
1. Kanyakumari ...	947	
2. Nilgiri ...	944	
3. Thanjavur ...	921	
4. Tirunelveli ...	919	
5. Ramanathapuram ...	913	
6. South Arcot ...	900	
7. Chingleput ...	897	
8. North Arcot ...	889	
<b>Below State average</b>		
1. Madurai ...	884	
2. Tiruchirapalli ...	884	
3. Coimbatore ...	859	
4. Salem ...	840	
<b>Above State average</b>		
1. Kanyakumari ...	969	
2. Thanjavur ...	959	
3. Chingleput ...	947	
4. Nilgiri ...	941	
5. South Arcot ...	938	
6. North Arcot ...	923	
7. Tirunelveli ...	921	
<b>Below State average</b>		
1. Madurai ...	917	
2. Ramanathapuram ...	917	
3. Tiruchirapalli ...	899	
4. Coimbatore ...	881	
5. Salem ...	874	

**Non-workers in cities with one lakh and above**

7. The distribution of 1,000 population of each sex in each age-group into workers and non-workers for cities, and six classes of towns is presented in the table given below.

TABLE XIII—5

A detailed discussion about the proportions of workers and non-workers in the different educational levels has been given in the chapter on literacy and education. Any further discussion here will be redundant.

#### Activities of Non-workers

11. As stated earlier non-workers have been

classified under eight groups according to their activity. The statement below shows the non-workers of each sex classified by the type of activity in the total, rural and urban sectors of the State;

TABLE XIII — 9  
Non-workers by type of activity

Type of activity	Total			Rural			Urban		
	Persons	Males	Females	Persons	Males	Females	Persons	Males	Females
I	2	3	4	5	6	7	8	9	10
Total	(a) ... 18,335,332	6,807,652	11,527,680	12,438,487	4,662,695	7,775,792	5,896,845	2,144,957	3,751,888
	(b) ... 100·00	100·00	100·00	100·00	100·00	100·00	100·00	100·00	100·00

	(b) ... 2·62	3·2	2·3	2·62	2·6	2·7	2·63	4·7	1·5
V. Beggars, Vagrants	(a) ... 39,770	23,414	16,356	21,561	11,800	9,761	18,209	11,614	6,595
	(b) ... 0·22	0·3	0·1	0·17	0·2	0·1	0·31	0·5	0·2
VI. Inmates of penal institutions, etc.	(a) ... 22,132	18,628	3,504	7,107	6,289	818	15,025	12,339	2,686
	(b) ... 0·12	0·3	N	0·06	0·1	N	0·26	0·6	0·1
VII. Persons seeking employment for the first time	(a) ... 102,528	95,753	6,775	31,235	29,257	1,978	71,293	66,496	4,797
	(b) ... 0·56	1·4	0·1	0·25	0·6	N	1·21	3·1	0·1
VIII. Persons employed before but now out of employment and seeking work	(a) ... 41,224	39,144	2,080	10,430	9,905	525	30,794	29,239	1,555
	(b) ... 0·22	0·6	N	0·09	0·2	N	0·52	1·4	N

(a)—Absolute figure

(b)—Percentage

'N' means negligible

It can be seen that dependants including infants not attending school constitute the major portion of the non-working population *i.e.*, 44·95%. Persons engaged in household duties form 30·48% and full-time students form 20·83%. These three categories account for 17,648,567 out of 18,335,332 non-workers, that is, 96·26%.

Dependants form a major proportion of males with 57·6%. Persons engaged in household duties form the largest proportion of females with 48·1%. Full-time students form 36% of the males as against 11·9% of females. The proportion of males engaged in household duties is nominal, *i.e.*, 0·6%. Beggars and vagrants show a percentage of 0·3 for males and 0·1 for females. Persons seeking employment for the first time and persons once employed but now out of employment and seeking work form 2% among males but only 0·1% among females. Dependants, infants and disabled have recorded a proportion of 49·87% in the rural sector as against 34·57% in the urban sector. Higher proportion is recorded under full-time students in urban areas. Again, the highest percentage is recorded in the urban areas in the category of persons doing household duties indicating less economic activity among urban women.

A comparison of the rural and urban populations reveal that the urban proportions are higher than the corresponding proportions in rural areas in all the categories of non-workers except in the category of dependants and infants.

Higher proportion in the urban sector under full-time students is justifiable in view of the facilities in the field of education available to urban inhabitants having large number of schools and colleges. Higher percentage in the urban areas in the category of household duties indicates lesser economic activity of urban women as seen earlier. Higher proportion under dependants, infants and disabled in rural areas may be due to the higher birth rate in rural areas than in urban areas.

As beggars and vagrants could thrive only in urban areas, it is but natural that their proportion is greater in urban than in rural areas. As most of the penal institutions are situated in urban areas, the proportion in this category of non-workers also is higher in urban areas.

The following table presents the distribution of 1,000 persons in each type of activity and in each sex by broad age-group.

TABLE XIII—10-A (concd.)  
*Distribution of 1,000 persons of each sex and type of activity of non-workers among the different age-groups. 1961*

**Beggars, vagrants, etc.**

12. Age-group 35-59 accounts for 41.9% of males and 35.7% of females who have been returned under this category. The age-group 15-34 ranks next with 24.1% of males and 27.3% of females. The last age-group of 60+ has 22.4% of males and 23.6% of females. Higher proportion for females than males is seen in all the age-groups except 35-59. Even the younger age-group of 0-14 has more than 11% of males and more than 13% of females under this category. Generally, beggars and mendicants are treated with sympathy by the public and as such persons of this category are found in all age-groups.

**Unemployed**

13. 134,897 males and 8,855 females were in search of employment at the time of Census. They form 2% of male non-workers and 0.1% of female non-workers. Out of the male and female unemployed, the never employed persons *i.e.*, persons who are seeking employment for the first time form 71% among males and 77% among females. The following statement presents the district-wise number of persons seeking employment for the first time arranged in descending order.

**Urban unemployed**

14. Union Table B-VIII Parts A and B indicates the age and educational levels of the unemployed population. As unemployment is greater in the urban sector than in villages, the table relating to urban areas is more elaborate.

At the time of 1961 Census, 102,087 persons consisting of 95,735 males and 6,352 females were counted as unemployed in the urban areas of the State. Out of them, 2,876 persons comprising of 2,777 males and 99 females were below 15 years of age. Out of the unemployed 92,958 males and 6,253 females aged 15 years and over 64,397 males and 4,754 females belong to the category of never employed, *i.e.*, seeking employment for the first time. The rest, numbering 28,561 males and 1,499 females have been returned as once employed but now out of employment and seeking work.

The higher number of males as compared to females among the unemployed persons has to be explained on the basis of the social and economic conditions of the country. A clear demarcation of work between the two sexes has been perpetuated by tradition and custom. Male has always been regarded as a principal earner whose responsibility is to maintain the family. Women on

the other hand are required to take care of children and look after the households their prime function. The present day increasing cost of living, higher education of women and belief in equality of sexes have however changed the notions relating to work and employment.

The following table gives the distribution of 1,000 unemployed persons in each sex among the never employed and the unemployed in the urban areas of the State and districts and in individual cities and town-groups having a population of 1,00,000 and more.

TABLE XIII—II

*Distribution of 1,000 unemployed persons by sex between those seeking employment for the first time and those employed before but now out of employment and seeking work in Cities, Town-groups and Districts, 1961*

City, Town-group and District	Total unemployed		Seeking employment for the first time		Persons employed before but now out of employ- ment and seeking work	
	Males	Females	Males	Females	Males	Females

11. Ramasathapuram ...	1,000	1,000	654	735	346	265
12. Tirunelveli ...	1,000	1,000	627	644	373	356
13. Kanyakumari ...	1,000	1,000	726	915	274	85

NOTE :—The figures are only for persons aged 15 and above.

It can be seen from this table that in all places and among both sexes the proportion of persons seeking employment for the first time is more than 60%. Particularly among females the proportion of persons seeking employment for the first time is much greater. It will be significant to note that in big cities like Madras and Coimbatore, the proportion of persons seeking employment once again is greater. Important cities generally attract job seekers.

**Persons seeking employment for the first time by educational levels and age-groups**

15. The proportion of urban never employed among the various age-groups in each sex is as follows :—

Age-group	Males	Females
15—19	37·05	45·62
20—24	40·73	40·30

Age-group	Males	Females
25—29	12·52	9·28
30—34	4·31	3·24
35+	5·38	1·56
A.N.S.	0·01	...

Among both the sexes about 80% of the never-employed are in the age-group of 15 to 24. While among males the highest proportion is in the age-group 20—24, among females the highest proportion is in the age-group 15—19. Table XIII-12 gives the distribution of 1,000 persons in each sex and in each age-group seeking employment for the first time by educational levels in urban areas of the State.

TABLE XIII—12

*Distribution of 1,000 persons of each sex and age-group of persons seeking employment for the first time and between the various educational qualifications, 1961*

State	Age-groups													
	Total		15—19		20—24		25—29		30—34		35+		Non-working Population	
	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females

Veterinary and dairying	N	...	...	...	...	...	N	...	...	...	...	...		
Technology	N	...	...	...	N	...	1	...	...	...	...	...		
Teaching	N	5	N	N	1	4	1	18	1	32	N	14		
Others	N	...	...	...	...	...	N	...	N	...	...	...		

It is found that among males in search of employment for the first time, only 10·0% are illiterates. Primary or Junior Basic qualified males form one-third with the highest proportion of 34·6% and persons qualified in Matriculation or Higher Secondary another one-third (31·0%). The mere literates form about one-fifth (21·1%). The University degree holders other than technical degrees form 2·9%. As the technical degree or diploma holders form only 0·1% of the male never employed persons, it can be inferred that technically qualified people do not find it difficult to secure employment. Illiterate females who seek employment form only 4·4% which is comparatively lower than the proportion for males. Matric or Higher Secondary qualified females form the highest proportion of 55·2% among the never-employed females and the Primary or Junior Basic qualified form 30·8%. University degree holders other than technical degree form 4·1% which is greater than the corresponding proportion among males.

#### **Distribution of unemployed persons by age-group and educational levels**

16. 29,239 males and 1,555 females have been counted as once employed and seeking work again in the urban areas of the State. Out of these persons 678 males and 56 females are in the essentially non-working age-group of 0-14. The

distribution of unemployed persons aged 15+ by certain age-groups are indicated below :

	Population		Percentage	
	Males	Females	Males	Females
Total	28,561	1,499	100·00	100·00
15—19	3,811	395	13·34	26·35
20—24	6,442	498	22·56	33·22
25—34	7,389	313	25·87	20·88
35—44	5,219	113	18·27	7·54
45—59	4,407	102	15·43	6·81
60+	1,292	78	4·53	5·20
A.N.S.	1	...	N	...

It may be seen that males, as in the case of never employed category, predominate numbering 28,561 out of a total of 30,060 persons. When the age distribution is seen, age-group 25-34 has the maximum number for males and 20-24 for females. Next comes age-group 20-24 for males and 15-19 for females. Unlike in the case of never employed persons, which are heavily concentrated in the younger age-groups, in the category of unemployed persons, one can find them distributed in the younger as well as older age-groups.

Similar to Table XIII—12, a table is presented below for persons classified as having been employed before and now out of work and seeking employment.

TABLE XIII — I3

*Distribution of 1,000 persons of each sex and age-group of persons employed before but now out of employment and seeking work and between the various educational qualifications, 1961*

State	Total		Age-groups									
			15-19		20-24		25-34		35+

Teaching	N	13	...	...	N	16	N	5	N	N		
Others	N	...	...	...	...	...	...	...	N	N		

Illiterate males show a proportion of 16·0% as against 84·0% for literate and educated persons. For females, illiterates show a proportion of 18·3% and literate and educated 81·7%. Compared to the never employed, illiterate persons of both the sexes are more in the category of seeking re-employment than under never employed category. Among the literate and educated persons seeking re-employment, in the case of males, simple literates with a proportion of 33·2% takes the first rank, followed by Primary or Junior basic level with 32·8% and the third rank is occupied by Matric or Higher secondary with 16·1%. Among females, the first place goes to Matric or Higher Secondary level with 36·6% followed with 28·4% in the level of Primary or Junior Basic and thirdly with 11·1% in the level of simple literates. Whereas in the case of the never employed persons, proportion for illiterate under females is less than males, in the case of unemployed persons proportion of illiterate male seeking re-employment is less. University degree holders seeking employment once again show a proportion of 1·5% for males and 3·7% for females. Holders of technical degree or diploma equal to degree or post-graduate degree shows 0·2% for males and 1·5% for females. Engineering and Medicine account for the major portion of this proportion under males and medicine and teaching under females.

Analysing the proportion for various educational levels by broad age-groups, for males, the highest proportion is to be seen in the level of Primary or Junior Basic in all age-groups except 35+. In this age-group, simple literates assume more importance. In the case of females in the age-groups 15-19 and 20-24, Matriculation or Higher Secondary is the prominent level and in the age-groups of 25-34 and 35+, educational levels of Primary or Junior Basic and simple literates become prominent. Proportions for illiterate females are less than those of males in the age-groups 15-19 and 20-24 and more in the other age-groups. Proportions of simple literates and/of Primary or Junior Basic are less among females than compared to males in all age-groups except 25-34. In this age-group while the proportion for females is less under simple literate category, it is higher under Primary or Junior Basic.

#### Workers and Non-workers in the various categories of population

17. Table XIII—14 presents the distribution of 1,000 persons of each sex among the general population, migrants, scheduled castes and scheduled tribes into workers and non-workers for the State and Districts.

TABLE XIII—14

*Distribution of 1,000 of total population of each sex between workers and non-workers in the (i) General Population, (ii) Migrants, (iii) Scheduled Castes and (iv) Scheduled Tribes in the State and districts, 1961*

		(d)	1,000	1,000	593	324	407	676

In the State as a whole, the proportion of workers among males is the highest among migrants with a proportion of 686. Among females, scheduled tribes claim the highest proportion with 490. Compared to other categories of population, general population has the lowest proportion of workers in both the sexes (Males-597, Females-313). Consequently, we find higher proportions of non-workers among the general population and lower proportions in the other categories. We also see that proportions of non-workers is higher in the case of females than among males in all the four categories of population detailed above.

In the case of males, all the districts show the lowest proportion of non-workers in the category of migrants similar to that of the State trend. Among females, the districts of Madras, Chingleput, Salem and Madurai follow the trend noticed in the State as a whole in having the lowest proportion of non-workers among scheduled tribes.

One of the dominant factors influencing migration is the movement of population in search of employment and therefore low proportion of non-workers among migrants is not surprising.

While migration among males is mainly out of economic activity, migration among females is mainly a social movement due to marriage relationship. Among scheduled castes and scheduled tribes both the sexes contribute a lower proportion of non-workers.

Non-workers among scheduled tribes show a proportion of 358 for males and 510 for females. The proportions are lower compared to the proportions shown by the general population. These trends are noticed in all the districts except Coimbatore, Tiruchirapalli, Ramanathapuram and Tirunelveli. From the above analysis it can be noticed that the proportion of non-workers is lower among tribal and scheduled caste population than the general population, particularly in the case of women.

#### **Full-time students and unemployed persons among Scheduled Castes, Scheduled Tribes and general population**

18. For comparing the proportions of full-time students and unemployed persons in the three categories of population, Table XIII-15 is presented.

TABLE XIII—15  
Distribution of 1,000 of total population of each sex and educational standard among non-workers in  
(i) the General Population (ii) Scheduled Castes and (iii) Scheduled Tribes in the State, 1961

	All Standards	1,000	1,000	135	43	2	N	2	N	861	957
	All Standards	1,000	1,000	360	119	14	1	6	N	620	880

Full-time students under male non-workers show a proportion of 360 in the general population as compared to 249 among scheduled castes and 135 among scheduled tribes. Female full-time students show a proportion of 119 among

the general population as against 71 under scheduled castes and 43 under scheduled tribes. These proportions in a way indicate the low literacy level of scheduled castes and scheduled tribes.

## ANNEXURE—I

*Extract from the Census of India, 1961 Enumeration Manual—Instructions pertaining to economic questions prescribed for 1961 Census*

### **Distinction between workers and non-workers**

39. (a) **Questions 8 to 11:** The population of any country can be divided into workers and non-workers. Questions 8 to 11 apply to workers and their answers are of vital importance to our Census statistics. A person may be working as cultivator or an agricultural labourer or in any household industry or may be engaged in doing some other work. The last named category will include persons who are engaged in productive activities other than cultivation, business, trade, communication or transport service or other miscellaneous services. In the case of persons who are employed during certain specified seasons only, as in cultivation, livestock, household industry, will be regarded as worker, provided he has some regular work for more than an hour per day throughout the greater part of the working season. In the case of persons regularly employed in any trade, profession, service or business or commerce, he will be considered as a worker if he was employed during any of the 15 days preceding the day on which you make your visit to the household. The entries made against this question need not be revised even if the person is found to be unemployed during your second visit to the household for the revisional round from 1st March to 5th March, 1961. A person who works but was absent from his work during the 15 days preceding the day on which he was enumerated due to illness or other causes should be treated as a worker. It should be remembered that work not only includes actual manual labour but also effective supervision and direction. For example, a person having few acres of land may be supervising and directing without ploughing and harvesting himself. Such a person has to be regarded as worker. Persons under training as apprentices with or without stipend will also be regarded as workers. A public or social workers

engaged actively in public or social work or a political worker actively engaged in furthering the political aims of his party should also be regarded as a worker. Under-trial prisoners of persons who are in jail but have not been convicted by a Court of law may be regarded as workers if they were engaged in any of the activities, which are considered as work by our definition, before their arrest. Similarly, persons who are admitted in hospitals or sanatoriums may be considered as workers if they were engaged in activities which are considered as work before they were so admitted.

(b) A person who has secured employment or has been offered a job but has not actually joined duty should be regarded as non-worker. Any adult woman engaged in household duties, however, useful it be, should not be considered as a worker. But if, in addition to her household duties, she is engaged in items of work like hand-pounding of rice, spinning of cotton etc., which gives her some monetary reward either in cash or in kind or is employed on domestic duties for wages as servant-maid, ayah or cook or is employed in selling firewood, cutting and selling of grass, etc., she should be regarded as a worker.

(c) Beggars, pensioners, rent or dividend receivers who may be earning an income but are not participating in any productive work should not be considered as workers, unless they are also engaged in industry, trade or commerce. Those persons, who are long-term inmates of penal, charitable or mental institutions, even though previously engaged in activities which satisfy our definition of work, should be regarded as non-workers.

(d) After understanding the principles enunciated above regarding the classification of workers and non-workers you may now proceed to elicit answers to the questions. A person may be engaged in cultivation, in household industry

or may be working as an agricultural labourer or doing some other work. He may be engaged in one of the above four categories or in more than one. A person working both as cultivator and agricultural labourer will be entered, as such, against questions 8 and 9. A person who is working both as cultivator and in household industry will be entered against questions 8 and 10. Persons working in any of the possible combination of cultivation, agricultural labour, household industry and other kinds of work will be entered in the appropriate places, as in the examples mentioned above. If a person is engaged in only one kind of work, he will be entered against one of the four questions 8 to 11. A person who is engaged in various kinds of work will necessarily have one item of work which he considers to be the predominant or principal work. It, therefore, becomes necessary to decide for the purpose of our enumeration, what work is his principal work and what is his subsidiary work. The principal work is defined for our purposes as one in which a person spends most of his working time and not the one from which he gets the maximum income.

(e) After having collected the answers to questions 8 to 11, if you find any person with more than one productive activity you should ask him which one of the productive activity mentioned by him is his principal work. Put a ring round the number of the questions 8, 9, 10, 11 to indicate his answer.

To illustrate, a person who returns himself as cultivator and who is engaged in some household industry tells you that he spends a major portion of his time in cultivation. Cultivation is his principal work and you should put a ring round question 8, against which his principal work, cultivation has been recorded. If only two items of work are recorded and one has been shown as principal work by circling the question number against which the principal work is recorded, the other work recorded in any of the other questions 8 to 11 can be treated as his secondary occupation. But it may happen that more than two productive activities are recorded against questions 8 to 11.

In such cases you should ascertain the work which is next in importance to his principal work and it will be the work, which after his principal work, occupies most of his time. His subsidiary occupation should be indicated by a tick mark on the right hand side of the appropriate question number. For example, if a person is engaged in cultivation and is also working as an agricultural labourer and in household industry, entries will be found against questions 8, 9 and 10. If, on enquiry, his principal work is known to be cultivation, a ring will be put round question 8, which relates to cultivation. If the person says that the work next in importance to cultivation is household industry a tick mark will be noted against question No. 10 on the right hand side.

#### EXAMPLES

- 8. Working as Cultivator C
- 9. Working as Agricultural Labourer AL
- 10. Working at Household Industry Joiner
  - (a) Nature of work
  - (b) Nature of Household Industry Wooden toys making
  - (c) If employee :

40. Question 8 : According to our definition, a person is said to be a cultivator if he or she is engaged as an employer, single worker or family worker in :

(i) Cultivation of land or supervision or direction of cultivation of land owned or held from Government.

(ii) Cultivation of land or supervision or direction of cultivation of land held from private persons or institutions, for payment in money, kind or share in the produce of crop.

(iii) It is not necessary that a person should own the land absolutely. Even if the land cultivated is held on lease or under a variety of tenures the person will be entitled to be regarded as a cultivator. Cultivation involves ploughing, sowing, and harvesting and does not include the growing or keeping of orchards or groves or working in plantations like tea, coffee, rubber,

cinchona and other medicinal plants. Persons engaged in tree growing or working in plantations like tea, coffee, rubber, cinchona should not be treated as cultivators but should be entered against Question 10 or 11 as the case may be. A person who leases out his lands to others for cultivation and gets a return in the shape of money or share of the crop and who does not even supervise and direct cultivation of land will not be treated as cultivator. Similarly, a person working on another person's land as agricultural labourer and has no right or lease on the land on which he works, is not responsible for taking decisions as to the kind of crop to be sown and is paid wages in cash or kind, will not be treated as cultivator.

(a) Persons engaged in cultivation involving ploughing, sowing, harvesting of cereal crops such as rice, wheat and maize, tuber crops like potato and sweet-potatoes, sugar-cane, bengal gram, pulses such as ground-nut, kesar and other crops. Production of raw jute and kindred fibre crops and production of raw cotton are considered to be cultivators.

(i) The land may be owned by any person in the household and the other members may be engaged in the cultivation, supervision or direction of all agricultural operations. You should ask the person enumerated, the question "Do you possess or hold any land or does your household possess or hold land?"

(b) If so, "Are you engaged in the cultivation of land or supervision or direction of land owned or held?"

The answers obtained should be recorded as follows:

'C' should be written in the cases of persons working as cultivators.

'X' for persons not working as cultivators or not working at all.

### Working as Agricultural Labourer

41. Question 9: Agricultural labourer is a person who works on another's land for wages in cash or kind without having any supervision or direction in cultivation. The labourer will not

have any right to lease the land on which he works nor will he be responsible for the crop he sows and he does not take any risk of cultivation. He may be paid his wages in kind. A person should have been working as agricultural labourer in the last or current cultivating season. After ascertaining from the person whether he works for wages on another person's land without any right to lease or contract, etc., he should be treated as an agricultural labourer and 'AL' should be recorded against this question. 'X' should be recorded for inapplicable cases.

### Household Industry

42. (a) Question 10 (a). It is defined as an industry conducted by the head of the household himself and/or by the members of the household/or at home within the village in rural areas and only at home in urban areas. In other words, a household industry can be located at home and within the limits of the villages in rural areas. In urban areas, the industry must be confined to the house or at least a major part of the work must be located at home. In the case of urban areas, where the industry is not conducted at home but is situated elsewhere it should not be treated as a household industry. The industry should not also be run on the lines of a factory. For purposes of classifying as a factory, an establishment should employ 20 persons when no power is used and 10 persons where some kind of power is used.

(b) A household industry should relate to the production, processing, servicing, repairing or making and selling of goods but should not be confined to the process of buying and selling alone. For example, it does not include professions such as Pleader, Doctor and Astrologer. The test is mainly three-fold:

(i) A household industry should embrace manufacture, processing or servicing and may include sale but is not confined simply to purchase and sale. At least part of the goods offered for sale should be manufactured there.

(ii) A household industry should not be

carried on, on the scale of a registered factory, but should be confined to the household scale where the workers will be composed of the head of the household and the members of the household, the role of hired workers from outside, being of minor importance. The members of the household should be in a position to work in the industry whenever they find time from their daily routine. A household industry can use machinery and employ power like steam, electricity, oil etc., to drive the machinery.

(iii) Location is another important factor in classifying an industry as a household industry, for proximity decides participation by members of the household. In rural areas, if the industry is located within the village instead of at home, it is possible for members of the household to move about freely in the village to look after the work. In urban areas, such free movement is not possible. Therefore, in urban areas, the definition of household industry is limited to industries which are located at home though part of the work may be done outside. To quote an example, in a house situated in an urban area weaving is done, for which the yarn has to be dyed before being used in looms for weaving. The dyeing of yarn may be done outside the house in an open space or even in a shed, some distance away from the house. The weaving industry, in this case, will be treated as a household industry, even though the dyeing of yarn is done outside the house. Some examples of household industry are given as Appendix IV to this booklet to which you can refer while filling these columns e.g., beedi workers, who either singly or with the help of the members of the family roll beedies at home for wages, while the contractor supplies the materials, certain processes like buttoning and hand-sewing of cloth are carried on at home by members of the household, both at residence and at the place of work, where women-folk of the household fill at home with lac, gold ornaments prepared at the shop by male members of the

These activities can also be regarded as illustrations of household industry.

(c) Your task is to find out the nature of the work and the nature of the household industry. The status of the persons engaged in the industry should be recorded against this question. If an industry is conducted on the scale of a household and the person enumerated is a member of the same household participating in the industry, you should ascertain the nature of work which he is doing and enter it against question 10 (a). The nature of the household industry in which he is working should be entered against question 10 (b). In such cases question 10 (c), "If employee" is not applicable and an 'X' has to be written within the triangle set apart for the purpose.

(d) There are persons who may not be working in their own household industry but may be working as paid employees in another household industry. In that case, for such persons, the nature of work and the nature of household industry should be recorded against question 10 (a) and 10 (b) with respect to the household industry in which they are working and "EE" should be recorded against question 10 (c) in the triangle.

(e) There may be others who might be working unpaid in another industry carried on by a household in which they are not members. Even in such cases the correct particulars should be recorded against question 10 (a) and 10 (b) and 'EE' entered against question 10 (c). But apprentices who are working without wages or for a stipend and are normally resident with the household may be considered to be part of the household and the correct particulars entered against question 10 (a) and (b). Against question 10 (c), 'X' will be recorded within the triangle. But such of those apprentices who are not normally resident in the household and who do not form part of the household, may be treated as employees, irrespective of the fact whether they get a stipend or not and 'EE' entered in the

triangle against question 10 (c). A few [redacted] against question 10 (a), (b) and (c) are furnished examples as to how the answers are to be recorded below :—

(1)	10 (a) Nature of work	10 (b) Nature of Household Industry	10 (c) if employee
(2)	(3)	(4)	
1. Persons employed as Dyer of yarn in handloom weaving conducted by another household	Dyeing yarn ...	Handloom weaving (dhoties and towels)	EE
2. Person working as setter of precious stones in family jewellery	Stonesetter ...	Gold and diamond jewels making	X
3. Member of the household engaged in polishing wooden dolls made in the household	Polishing wooden dolls	Wooden dolls making ...	X
4. Person employed for painting clay toys and dolls made in household industry at another household	Painting clay dolls and toys	Clay dolls and toys making ...	EE
5. Person joining sides of wooden boxes made in the household	Joiner ...	Wooden boxes making ...	X
6. Person making pots ...	Throwing and turning pottery	Earthen pottery ...	X
7. Person employed for filling with lac in household making silver images	Filling silver ...	Silver smithy ...	X
8. A member of the household maintaining accounts in a household establishment of drugget manufacturers	Keeping accounts ...	Drugget manufacture ...	X
9. Person employed to drive the bulls in an oil-chekku	Labourer employed in driving bulls of oil-chekku	Oil crushing ...	EE
10. Household member doing scrapping of rust, etc. of metal in a household doing electro-plating	Scrapping and cleaning	Electro-plating ...	X
11. Person spinning yarn ...	Spinning yarn on Ambar Charka	Yarn spinning ...	X

**Doing work other than those mentioned in questions 8, 9 and 10**

43. Question 11:—This is not applicable to persons working as cultivator or as agricultural labourer or in any household industry. As indicated earlier, cultivation involves ploughing, sowing and harvesting of certain specified crops. Growing of other field produce and plantation crops does not come within the purview of cultivation and has to be entered against question 11. A few examples of other field produce and plantation crops are furnished below for your guidance.

**(a) Other field produce :**

(i) Production of fruits and nuts in plantations and orchards (like Cocoanut, Arecanut, etc.)

(ii) Production of wood, bamboo, cane reeds, thatching grass, etc.

(iii) Production of other agricultural produce (including fruits and nuts not covered by item No. 1 and flowers) not covered above.

**Plantation Crops :**

(i) Tea Plantations

(ii) Coffee Plantations

(iii) Rubber Plantations

(iv) Production of tobacco on a large scale. This does not include tobacco which is cultivated as a rotation crop with other cereal crops, in which case it would be defined as cultivation crop.

(v) Production of ganja, cinchona, opium, pepper, saffron, etc.

(vi) Production of other plantation crops not covered by the above items (e. g., cardamom, clove and other spices).

If a person is doing some other work in addition to the three items mentioned above or if a person is not working in any of the three categories, cultivation, agricultural labour or at household industry, the details of the work he is doing will be recorded against this question. If a person is engaged in more than one work and neither of them relate to any of the three categories men-

tioned above, write here the work for which he devotes a major part of his time.

(b) This question is divided into four parts. 11 (a) the nature of work, 11 (b) the nature of industry, profession, trade or service, 11 (c) class of worker and 11 (d) the name of the establishment in which the person is working. This question will not apply to persons who are not working or who work in any of the three categories mentioned earlier. For such persons write 'X' in all the four parts of this question.

(c) Detailed instructions for filling in the four parts are given below:—

11 (a): Full information as to the nature of work done by the persons should be recorded either in the vernacular or in English. If full information is not furnished, the correct position may not be ascertained. Against Question 11 (b) you should describe in detail the nature of industry, business, trade or service in which the person works. In the case of persons working in industries, the name of the articles produced, serviced or repaired should be clearly specified, e.g., Manufacture of Automobile Pistons, etc. Manufacture of Torch Light Cells or Bicycles, retreading of car and truck tyres, repairing of musical instruments, etc. If more than one article is produced, repaired or serviced, the name of the chief article produced, repaired or serviced should be indicated. In the case of business or trade the principal article of trade should be described and the fact whether retail or wholesale trade is carried on should also be indicated.

*Example:* Wholesale trade in cotton seeds, retail trade in cotton textiles, wholesale trade in jaggery, retail trade in stationery article, etc.

(d) In the case of service, describe the nature of service under which the person's work can be classified. The description recorded under question 11 (b) should be of the nature as would permit the classification of the establishment under the Industrial Classification Code, correctly. Some of the important points to be borne in mind while recording answers to questions 11 (a) and (b) are briefly mentioned below.

(i) In the case of women or children who help in work such as rice pounding or doing domestic service for wages or minding cattle or selling firewood or making and selling cowdung

cakes, grass, etc., the nature of work should be described fully even if they work part-time. In the case of married or grown up women who do any of the work mentioned above, in addition to the usual household duties, such work should be fully described and 'HW' written in brackets after the full description.

(ii) If a person produces the article he sells, he should be entered as a producer-cum-seller.

(iii) Wherever possible, the work should be indicated by the vernacular name by which it is commonly known.

(e) The following terms which are vague must not be used when it is used to qualify the nature of work.

(iv) Scientist, Technician, Civil Servant, Clerk, Engineer, Inspector, Checker, Foreman, Overseer, Supervisor, Labourer, Machinist, Assistant, Contractor, Polisher.

(f) On the contrary such terms as Travelling Ticket Inspector, Contractor for building house, Government, P. W. D. Contractor, in charge of roads, Railway Goods clerk in the Southern Railway may be used, as they clearly indicate the nature of work.

(v) Labourers: For an unskilled labourer usually employed on one work only, indicate clearly the nature of work done, e. g., Railway Porter, Market or Bazaar Porter, Labourer employed on road digging, brick layer etc.,

(vi) Machine Operators: Always state the kind of machine operated by the person.

(vii) Shop-keeper: Retail dealers and shop assistants if wholly or mainly engaged in selling, write 'Dealer' (if principal) or Shop Assistant or Salesman (if assisting) and state whether the business in wholesale or retail, or both.

(viii) Transport Workers: Describe fully the nature of the transport, e. g., air transport, rail transport, transport by motor car or motor cycles or vehicles drawn by horses, etc.

(ix) Services: For persons engaged in the Defence Services, write Service of the Central Government and Central Government employees against the nature of work.

(x) If the job is known in trade or industry by a special name, that name should be recorded. Managers, Foreman, etc., should be specified by the department in which they are working, e. g. Sales Manager, Machine Shop Foreman and Boi-

Room Foreman, etc. The following terms should not be used alone:-

Manufacturer, Merchant, Agent, Broker, Refractor, Dealer, Engineer and Iron Works. etc.

(xi) Domestic Services: In the case of a private services i. e., a Cook or Domestic Servant write private Cook or Domestic Servant. However, in the case of persons employed in hotels or restaurants, institutions, etc. the words hotel or restaurant, etc. should be added.

(g) For persons in the employ of firms carrying on two or more businesses if the businesses are carried on in separate premises, then the business carried on at the premises in which the person is employed should be given. Where two activities are carried on side by side, the primary or major activity of the firm or establishment should be specified.

(h) Commerce: The distinction between wholesale and retail business must be kept in mind. As in the case of other industries the goods handled should be clearly indicated.

### **Class of Worker**

44. (a) Question 11 (c):—A person may be an employer or an employee, a single worker or a family worker in industry, trade, profession or service in which he is working. Employer, to define specifically is a person who employs other persons in order to perform the work recorded against question 11 (a). As such he is not only responsible for his own work but also for the work done by others in the business mentioned above. However, a person who employs domestic servants for household duties or subordinates under him in an office where he is employed by others, (e.g.) Manager of the head of the department, does not come under the definition of an employee, even if he has been delegated the power to employ another person in his office on behalf of his employer or employers.

(b) An employee is a person who usually works under some person for salary or wages in cash or kind. Of course, there may be persons who are generally employed as Managers, Superintendents, Agents, etc., and in that capacity employ or control other workers on behalf of their own employers. Such persons are considered as employees.

Single worker is a person who works by himself but not as the head of the household or in a household industry.

He is not employed by anyone else and in his turn does not employ anyone, not even the member of his household, except casually. This definition of single worker includes a person who works in joint partnership with one or several persons, hiring no employees and also a member of a Producers' Co-operative. Each one of the partners or members of such Producers' Co-operative should be recorded as 'Single worker'.

(c) A family worker is a person who works without receiving wages in kind or cash in any business or trade conducted mainly by the members of the family and ordinarily does at least one hour of work every day during the working seasons.

(d) For the purpose of entire question 11 the reference to industry differs mainly from the household industry, in that, the industry is carried on a scale larger than what is covered under the former. The industry may be run at home or away from home in urban areas and even away from village in rural areas and should ordinarily be in the nature of a recognised Partnership, Joint Stock Company or a Registered Factory. For the purpose of this definition members of a family may be drawn from beyond the limits of the household by ties of blood or marriage. A family worker may not be entitled to a share of the profits in the work of the business carried on either by the person or head of the household or other relatives.

(e) Members of the household, who help in performing household duties should not be treated as family workers.

To record the class of worker you should ask the person enumerated the following questions:—

(i) Are you an employer (*i.e.*,) employing others in your work? or

Are you an employee (*i.e.*,) employed by others for wages or salaries in cash or kind? or

(iii) Are you a single worker working singly without employing others? or

(iv) Are you a family worker, (*i.e.*,) helping in the family work without wage or salary in cash or kind.

(f) The answers obtained to these questions should be recorded by the authorised abbreviations as under:—

MR — For employer

EE — For employee

SW — For single worker and

FW — For family worker

For Persons to whom 'X' has been written against question 11 (a) and 11 (b) write 'X' against this question also.

#### Name of Establishment

45. (a) Question 11 (d): You should record the details of the name of the Factory, Workshop, Business House, Industry, Shop, etc., and also the place in which the same is situated. If a person has no fixed place of work, write "No fixed place of work".

(b) In some of the enumeration slips issued to you, an error in printing has crept in. In the vernacular forms this error has not been noticed. In English forms, instead of printing the words "name of the establishment" against question 11 (d) the words "nature of establishment" has been wrongly printed.

(c) As soon as you read these instructions kindly take up the enumeration slips issued to you and correct the words to read as "name of the establishment". This has to engage your attention immediately.

(d) A few illustrative answers to questions 11 (a) to 11 (d) are given below:

	11 (a)	11 (b)	11 (c)	11 (d)
1. Labourer in Coffee Plantation	Plantation labourer	Coffee	EE	Kannan Devan Coffee Plantations, Pattiveeranpatti
2. Technical Officer, Drugs Control Organisation, Madras	Technical Officer for Drugs	Drugs control organisation.	EE	Government of India, Assistant Drugs Controller, Madras

46. Activity if not working: (a) Question 12: This applies to persons who are not working, *i.e.*, those who are not engaged in cultivation, agricultural labour, household industry, trade, profession or service.

This category includes persons who are not active in the sense that they are not engaged in any productive work. Beggars, pensioners, persons receiving royalty from agricultural land or non-

agricultural land, rent or dividend receivers, etc., though they may be earning an income do not participate in any productive work as well as inmates of institutions, convicts in jail, disabled persons not working, etc., are classified as persons "not working".

These persons have been grouped under eight different categories for Census purposes. Each

Authorised  
abbreviations
